## Konsep Struktur Data dalam Python

---

### 1. List in Python

#### List

Lists are used to store multiple items in a single variable.

Lists are one of 4 built-in data types in Python used to store collections of data, the other 3 are [Tuple](#), [Set](#), and [Dictionary](#), all with different qualities and usage.

Lists are created using square brackets:

#### Example

Create a List:

```
thislist = ["apple", "banana", "cherry"]  
print(thislist)
```

---

#### List Items

List items are ordered, changeable, and allow duplicate values.

List items are indexed, the first item has index `[0]`, the second item has index `[1]` etc.

---

#### Ordered

When we say that lists are ordered, it means that the items have a defined order, and that order will not change.

If you add new items to a list, the new items will be placed at the end of the list.

Note: There are some [list methods](#) that will change the order, but in general: the order of the items will not change.

---

#### Changeable

The list is changeable, meaning that we can change, add, and remove items in a list after it has been created.

---

## Allow Duplicates

Since lists are indexed, lists can have items with the same value:

### Example

Lists allow duplicate values:

```
thislist = ["apple", "banana", "cherry", "apple", "cherry"]  
print(thislist)
```

---

## List Length

To determine how many items a list has, use the `len()` function:

### Example

Print the number of items in the list:

```
thislist = ["apple", "banana", "cherry"]  
print(len(thislist))
```

---

## List Items - Data Types

List items can be of any data type:

### Example

String, int and boolean data types:

```
list1 = ["apple", "banana", "cherry"]  
list2 = [1, 5, 7, 9, 3]  
list3 = [True, False, False]
```

A list can contain different data types:

### Example

A list with strings, integers and boolean values:

```
list1 = ["abc", 34, True, 40, "male"]
```

---

type()

From Python's perspective, lists are defined as objects with the data type 'list':

```
<class 'list'>
```

### Example

What is the data type of a list?

```
mylist = ["apple", "banana", "cherry"]  
print(type(mylist))
```

---

### The list() Constructor

It is also possible to use the `list()` constructor when creating a new list.

### Example

Using the `list()` constructor to make a List:

```
thislist = list(("apple", "banana", "cherry")) # note the double round-brackets  
print(thislist)
```

---

## Python Collections (Arrays)

There are four collection data types in the Python programming language:

- **List** is a collection which is ordered and changeable. Allows duplicate members.
- **Tuple** is a collection which is ordered and unchangeable. Allows duplicate members.
- **Set** is a collection which is unordered, unchangeable\*, and unindexed. No duplicate members.
- **Dictionary** is a collection which is ordered\*\* and changeable. No duplicate members

## 2. Tuple in Python

### Tuple

Tuples are used to store multiple items in a single variable.

Tuple is one of 4 built-in data types in Python used to store collections of data, the other 3 are [List](#), [Set](#), and [Dictionary](#), all with different qualities and usage.

A tuple is a collection which is ordered and unchangeable.

Tuples are written with round brackets.

### Example

Create a Tuple:

```
thistuple = ("apple", "banana", "cherry")  
print(thistuple)
```

### Tuple Items

Tuple items are ordered, unchangeable, and allow duplicate values.

Tuple items are indexed, the first item has index `[0]`, the second item has index `[1]` etc.

---

### Ordered

When we say that tuples are ordered, it means that the items have a defined order, and that order will not change.

---

### Unchangeable

Tuples are unchangeable, meaning that we cannot change, add or remove items after the tuple has been created.

---

### Allow Duplicates

Since tuples are indexed, they can have items with the same value:

### Example

Tuples allow duplicate values:

```
thistuple = ("apple", "banana", "cherry", "apple", "cherry")  
print(thistuple)
```

---

### Tuple Length

To determine how many items a tuple has, use the `len()` function:

### Example

Print the number of items in the tuple:

```
thistuple = ("apple", "banana", "cherry")  
print(len(thistuple))
```

---

## Create Tuple With One Item

To create a tuple with only one item, you have to add a comma after the item, otherwise Python will not recognize it as a tuple.

### Example

One item tuple, remember the comma:

```
thistuple = ("apple",)  
print(type(thistuple))
```

```
#NOT a tuple  
thistuple = ("apple")  
print(type(thistuple))
```

---

## Tuple Items - Data Types

Tuple items can be of any data type:

### Example

String, int and boolean data types:

```
tuple1 = ("apple", "banana", "cherry")  
tuple2 = (1, 5, 7, 9, 3)  
tuple3 = (True, False, False)
```

A tuple can contain different data types:

### Example

A tuple with strings, integers and boolean values:

```
tuple1 = ("abc", 34, True, 40, "male")
```

---

```
type()
```

From Python's perspective, tuples are defined as objects with the data type 'tuple':

```
<class 'tuple'>
```

### Example

What is the data type of a tuple?

```
mytuple = ("apple", "banana", "cherry")
print(type(mytuple))
```

---

The tuple() Constructor

It is also possible to use the `tuple()` constructor to make a tuple.

Example

Using the `tuple()` method to make a tuple:

```
thistuple = tuple(("apple", "banana", "cherry")) # note the double round-brackets
print(thistuple)
```

---

Python Collections (Arrays)

There are four collection data types in the Python programming language:

- [List](#) is a collection which is ordered and changeable. Allows duplicate members.
- [Tuple](#) is a collection which is ordered and unchangeable. Allows duplicate members.
- [Set](#) is a collection which is unordered, unchangeable\*, and unindexed. No duplicate members.
- [Dictionary](#) is a collection which is ordered\*\* and changeable. No duplicate members

### 3. Dictionary in Python

Dictionaries are used to store data values in key:value pairs.

A dictionary is a collection which is ordered\*, changeable and do not allow duplicates.

As of Python version 3.7, dictionaries are ordered. In Python 3.6 and earlier, dictionaries are unordered.

Dictionaries are written with curly brackets, and have keys and values:

Example

Create and print a dictionary:

```
thisdict = {
    "brand": "Ford",
```

```
"model": "Mustang",  
"year": 1964  
}  
print(thisdict)
```

---

## Dictionary Items

Dictionary items are ordered, changeable, and do not allow duplicates.

Dictionary items are presented in key:value pairs, and can be referred to by using the key name.

### Example

Print the "brand" value of the dictionary:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
print(thisdict["brand"])
```

---

## Ordered or Unordered?

As of Python version 3.7, dictionaries are ordered. In Python 3.6 and earlier, dictionaries are unordered.

When we say that dictionaries are ordered, it means that the items have a defined order, and that order will not change.

Unordered means that the items do not have a defined order, you cannot refer to an item by using an index.

---

## Changeable

Dictionaries are changeable, meaning that we can change, add or remove items after the dictionary has been created.

---

## Duplicates Not Allowed

Dictionaries cannot have two items with the same key:

### Example

Duplicate values will overwrite existing values:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964,  
    "year": 2020  
}  
print(thisdict)
```

---

## Dictionary Length

To determine how many items a dictionary has, use the `len()` function:

### Example

Print the number of items in the dictionary:

```
print(len(thisdict))
```

---

## Dictionary Items - Data Types

The values in dictionary items can be of any data type:

### Example

String, int, boolean, and list data types:

```
thisdict = {  
    "brand": "Ford",  
    "electric": False,  
    "year": 1964,  
    "colors": ["red", "white", "blue"]  
}
```

---

`type()`

From Python's perspective, dictionaries are defined as objects with the data type 'dict':

```
<class 'dict'>
```

### Example

Print the data type of a dictionary:

```
thisdict = {  
    "brand": "Ford",  
    "model": "Mustang",  
    "year": 1964  
}  
print(type(thisdict))
```

---

### The dict() Constructor

It is also possible to use the `dict()` constructor to make a dictionary.

#### Example

Using the `dict()` method to make a dictionary:

```
thisdict = dict(name = "John", age = 36, country = "Norway")  
print(thisdict)
```

---

### Python Collections (Arrays)

There are four collection data types in the Python programming language:

- [List](#) is a collection which is ordered and changeable. Allows duplicate members.
- [Tuple](#) is a collection which is ordered and unchangeable. Allows duplicate members.
- [Set](#) is a collection which is unordered, unchangeable\*, and unindexed. No duplicate members.
- Dictionary is a collection which is ordered\*\* and changeable. No duplicate members.

\*Set items are unchangeable, but you can remove and/or add items whenever you like.

\*\*As of Python version 3.7, dictionaries are ordered. In Python 3.6 and earlier, dictionaries are unordered.

When choosing a collection type, it is useful to understand the properties of that type. Choosing the right type for a particular data set could mean retention of meaning, and, it could mean an increase in efficiency or security.

## 4. Sets in Python

Sets are used to store multiple items in a single variable.

Set is one of 4 built-in data types in Python used to store collections of data, the other 3 are [List](#), [Tuple](#), and [Dictionary](#), all with different qualities and usage.

A set is a collection which is unordered, unchangeable\*, and unindexed.

\* Note: Set items are unchangeable, but you can remove items and add new items.

Sets are written with curly brackets.

### Example

Create a Set:

```
thisset = {"apple", "banana", "cherry"}  
print(thisset)
```

Note: Sets are unordered, so you cannot be sure in which order the items will appear.

---

### Set Items

Set items are unordered, unchangeable, and do not allow duplicate values.

---

### Unordered

Unordered means that the items in a set do not have a defined order.

Set items can appear in a different order every time you use them, and cannot be referred to by index or key.

---

### Unchangeable

Set items are unchangeable, meaning that we cannot change the items after the set has been created.

Once a set is created, you cannot change its items, but you can remove items and add new items.

---

### Duplicates Not Allowed

Sets cannot have two items with the same value.

### Example

Duplicate values will be ignored:

```
thisset = {"apple", "banana", "cherry", "apple"}
```

```
print(thisset)
```

Note: The values **True** and **1** are considered the same value in sets, and are treated as duplicates:

Example

**True** and **1** is considered the same value:

```
thisset = {"apple", "banana", "cherry", True, 1, 2}
```

```
print(thisset)
```

Note: The values **False** and **0** are considered the same value in sets, and are treated as duplicates:

Example

**False** and **0** is considered the same value:

```
thisset = {"apple", "banana", "cherry", False, True, 0}
```

```
print(thisset)
```

---

### Get the Length of a Set

To determine how many items a set has, use the **len()** function.

Example

Get the number of items in a set:

```
thisset = {"apple", "banana", "cherry"}
```

```
print(len(thisset))
```

---

### Set Items - Data Types

Set items can be of any data type:

Example

String, int and boolean data types:

```
set1 = {"apple", "banana", "cherry"}
set2 = {1, 5, 7, 9, 3}
set3 = {True, False, False}
```

A set can contain different data types:

#### Example

A set with strings, integers and boolean values:

```
set1 = {"abc", 34, True, 40, "male"}
```

---

type()

From Python's perspective, sets are defined as objects with the data type 'set':

```
<class 'set'>
```

#### Example

What is the data type of a set?

```
myset = {"apple", "banana", "cherry"}
print(type(myset))
```

---

The set() Constructor

It is also possible to use the `set()` constructor to make a set.

#### Example

Using the `set()` constructor to make a set:

```
thisset = set(("apple", "banana", "cherry")) # note the double round-brackets
print(thisset)
```

---

Python Collections (Arrays)

There are four collection data types in the Python programming language:

- [List](#) is a collection which is ordered and changeable. Allows duplicate members.
- [Tuple](#) is a collection which is ordered and unchangeable. Allows duplicate members.
- [Set](#) is a collection which is unordered, unchangeable\*, and unindexed. No duplicate members.

- [Dictionary](#) is a collection which is ordered\*\* and changeable. No duplicate members.

\*Set items are unchangeable, but you can remove items and add new items.

\*\*As of Python version 3.7, dictionaries are ordered. In Python 3.6 and earlier, dictionaries are unordered.

When choosing a collection type, it is useful to understand the properties of that type. Choosing the right type for a particular data set could mean retention of meaning, and, it could mean an increase in efficiency or security
