Course Outline

1. Pengantar

- 1.1 Apa dan Mengapa Data Mining?
- 1.2 Peran Utama dan Metode Data Mining
- 1.3 Sejarah dan Penerapan Data Mining

2. Proses

- 2.1 Proses dan Tools Data Mining
- 2.2 Penerapan Proses Data Mining
- 2.3 Evaluasi Model Data Mining
- 2.4 Proses Data Mining berbasis CRISP-DM

3. Persiapan Data

- 3.1 Data Cleaning
- 3.2 Data Reduction
- 3.3 Data Transformation
- 3.4 Data Integration

4. Algoritma

- 4.1 Algoritma Klasifikasi
- 4.2 Algoritma Klastering
- 4.3 Algoritma Asosiasi
- 4.4 Algoritma Estimasi dan Forecasting

5. Text Mining

- 5.1 Text Mining Concepts
- 5.2 Text Clustering
- 5.3 Text Classification
- 5.4 Data Mining Laws

1. Pengantar Data Mining

1.1 Apa dan Mengapa Data Mining?

1.2 Peran Utama dan Metode Data Mining

1.3 Sejarah dan Penerapan Data Mining

1.1 Apa dan Mengapa Data Mining?

Manusia Memproduksi Data

Manusia memproduksi beragam data yang **jumlah dan ukurannya sangat besar**

- Astronomi
- Bisnis
- Kedokteran
- Ekonomi
- Olahraga
- Cuaca
- Financial
- ...

Pertumbuhan Data

Astronomi

- **Sloan Digital Sky** Survey
 - New Mexico, 2000
 - **140TB** over 10 years
- **Large Synoptic** Survey Telescope
 - Chile, 2016
 - Will acquire **140TB** every five days

kilobyte (kB)	10^3
megabyte (MB)	10^6
gigabyte (GB)	10^9
terabyte (TB)	10^{12}
petabyte (PB)	10^{15}
exabyte (EB)	10^{18}
zettabyte (ZB)	10^{21}
yottabyte (YB)	10^{24}

Biologi dan Kedokteran

- European Bioinformatics Institute (**EBI**)
 - **20PB of data** (genomic data doubles in size each year)
 - A single sequenced human genome can be around **140GB** in size

Datangnya Tsunami Data

- **Mobile Electronics** market
 - 7B smartphone subscriptions in 2015
- **Web & Social Networks** generates amount of data
 - Google processes 100 PB per day, 3 million servers
 - Facebook has 300 PB of user data per day
 - Youtube has 1000PB video storage

kilobyte (kB)	10^3
megabyte (MB)	10^6
gigabyte (GB)	10^9
terabyte (TB)	10^{12}
petabyte (PB)	10^{15}
exabyte (EB)	10^{18}
zettabyte (ZB)	10^{21}
yottabyte (YB)	10^{24}

Kebanjiran Data tapi Miskin Pengetahuan

We are drowning in data,
but starving for knowledge!

(John Naisbitt, Megatrends, 1988)

Mengubah Data Menjadi Pengetahuan

- Data harus kita olah menjadi **pengetahuan** supaya bisa **bermanfaat** bagi manusia

- Dengan **pengetahuan** tersebut, manusia dapat:

- Melakukan **estimasi** dan **prediksi** apa yang terjadi di depan
- Melakukan analisis tentang **asosiasi**, **korelasi** dan **pengelompokan** antar data dan atribut
- Membantu **pengambilan keputusan** dan **pembuatan kebijakan**

Apa itu Data Mining?

Disiplin ilmu yang mempelajari **metode** untuk **mengekstrak pengetahuan** atau **menemukan pola** dari suatu data yang besar

Apa itu Data Mining?

- Disiplin ilmu yang mempelajari **metode** untuk **mengekstrak pengetahuan** atau **menemukan pola** dari suatu data yang besar
- Ekstraksi dari **data** ke **pengetahuan**:
 1. **Data**: **fakta yang terekam** dan tidak membawa arti
 2. **Informasi**: Rekap, rangkuman, penjelasan dan **statistik dari data**
 3. **Pengetahuan**: **pola**, **rumus**, aturan atau model yang muncul dari data
- Nama lain data mining:
 - **Knowledge Discovery in Database (KDD)**
 - Big data
 - Business intelligence
 - Knowledge extraction
 - Pattern analysis
 - Information harvesting

Konsep Proses Data Mining

Himpunan Data

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \frac{b-a}{n} \sum_{k=1}^n f\left(a + \frac{b-a}{n} \cdot k\right)$$

$$-\left(-m e^{\frac{1}{2} \tan(\phi)}\right)\left[l - \frac{r^2}{4l} + r\left(\cos(\omega t) + \frac{r}{4l} \cos(2\omega t)\right)\right]$$

$$= F_1 e^{\left(-\zeta + \sqrt{\zeta^2 - 1}\right) \omega t} \quad \left(-\zeta - \sqrt{\zeta^2 - 1}\right) \omega t$$

Metode Data Mining

Pengetahuan

Definisi Data Mining

- Melakukan **ekstraksi** untuk mendapatkan **informasi penting** yang sifatnya **implisit** dan sebelumnya tidak diketahui, dari suatu data (*Witten et al., 2011*)
- Kegiatan yang meliputi pengumpulan, pemakaian data historis untuk **menemukan keteraturan, pola dan hubungan** dalam set data berukuran besar (*Santosa, 2007*)
- **Extraction of interesting** (non-trivial, **implicit, previously unknown** and potentially useful) **patterns or knowledge** from huge amount of data (*Han et al., 2011*)

Contoh Data di Kampus

- **Puluhan ribu data** mahasiswa di kampus yang diambil dari sistem informasi akademik
- Apakah **pernah kita ubah menjadi pengetahuan** yang lebih bermanfaat? TIDAK!
- Seperti apa pengetahuan itu? **Rumus, Pola, Aturan**

Revolusi Industri 4.0

Perusahaan Pengolah Pengetahuan

- **Uber** - the world's largest taxi company, owns no vehicles
- **Google** - world's largest media/advertising company, creates no content
- **Alibaba** - the most valuable retailer, has no inventory
- **Airbnb** - the world's largest accommodation provider, owns no real estate
- **Gojek** - perusahaan angkutan umum, tanpa memiliki kendaraan

Data Mining Tasks and Roles

Hubungan Data Mining dan Bidang Lain

Masalah-Masalah di Data Mining

1. Tremendous **amount** of data

- Algorithms must be **highly scalable** to handle such as tera-bytes of data

2. **High-dimensionality** of data

- Micro-array may have tens of **thousands of dimensions**

3. High **complexity** of data

- **Data streams** and sensor data
- **Time-series data**, temporal data, sequence data
- Structure data, graphs, **social networks** and multi-linked data
- Heterogeneous **databases** and legacy databases
- Spatial, spatiotemporal, **multimedia**, text and **Web data**
- **Software programs**, scientific simulations

4. New and sophisticated **applications**

Latihan

1. Jelaskan dengan kalimat sendiri apa yang dimaksud dengan **data mining**?
2. Sebutkan **konsep alur proses** data mining!

1.2 Peran Utama dan Metode Data Mining

Peran Utama Data Mining

Dataset (Himpunan Data)

Attribute/Feature/Dimension

Class/Label/Target

	Sepal Length (cm)	Sepal Width (cm)	Petal Length (cm)	Petal Width (cm)	Type
1	5.1	3.5	1.4	0.2	<i>Iris setosa</i>
2	4.9	3.0	1.4	0.2	<i>Iris setosa</i>
3	4.7	3.2	1.3	0.2	<i>Iris setosa</i>

Data**

Nominal

Numerik

Tipe Data

Tipe Data	Deskripsi	Contoh	Operasi
Ratio (Mutlak)	- Data yang diperoleh dengan cara pengukuran, dimana jarak dua titik pada skala sudah diketahui - Mempunyai titik nol yang absolut (*, /)	- Umur - Berat badan - Tinggi badan - Jumlah uang	geometric mean, harmonic mean, percent variation
Interval (Jarak)	- Data yang diperoleh dengan cara pengukuran, dimana jarak dua titik pada skala sudah diketahui Tidak mempunyai titik nol yang absolut (+, -)	- Suhu 0°C-100°C, - Umur 20-30 tahun	mean, standard deviation, Pearson's correlation, <i>t</i> and <i>F</i> tests
Ordinal (Peringkat)	- Data yang diperoleh dengan cara kategorisasi atau klasifikasi - Tetapi diantara data tersebut terdapat hubungan atau berurutan (<, >)	Tingkat kepuasan pelanggan (puas, sedang, tidak puas)	median, percentiles, rank correlation, run tests, sign tests
Nominal (Label)	- Data yang diperoleh dengan cara kategorisasi atau klasifikasi - Menunjukkan beberapa object yang berbeda (=, ≠)	- Kode pos - Jenis kelamin - Nomer id karyawan - Nama kota	mode, entropy, contingency correlation, χ^2 test

Peran Utama Data Mining

1. Estimasi Waktu Pengiriman Pizza

Customer	Jumlah Pesanan (P)	Jumlah Traffic Light (TL)	Jarak (J)	Waktu Tempuh (T)
1	3	3	3	16
2	1	7	4	20
3	2	4	6	18
4	4	6	8	36
...				
1000	2	4	2	12

Label

Pembelajaran dengan
Metode Estimasi (*Regresi Linier*)

$$\text{Waktu Tempuh (T)} = 0.48P + 0.23TL + 0.5J$$

Pengetahuan

Contoh: Estimasi Performansi CPU

- **Example:** 209 different computer configurations

	Cycle time (ns)	Main memory (Kb)		Cache (Kb)	Channels		Performance
	MYCT	MMIN	MMAX	CACH	CHMIN	CHMAX	PRP
1	125	256	6000	256	16	128	198
2	29	8000	32000	32	8	32	269
...							
208	480	512	8000	32	0	0	67
209	480	1000	4000	0	0	0	45

- **Linear regression** function

$$\begin{aligned} \text{PRP} = & -55.9 + 0.0489 \text{ MYCT} + 0.0153 \text{ MMIN} + 0.0056 \text{ MMAX} \\ & + 0.6410 \text{ CACH} - 0.2700 \text{ CHMIN} + 1.480 \text{ CHMAX} \end{aligned}$$

Output/Pola/Model/Knowledge

1. Formula/**Function** (Rumus atau Fungsi Regresi)

- $\text{WAKTU TEMPUH} = 0.48 + 0.6 \text{ JARAK} + 0.34 \text{ LAMPU} + 0.2 \text{ PESANAN}$

2. Decision **Tree** (Pohon Keputusan)

3. Korelasi dan **Asosiasi**

4. **Rule** (Aturan)

- IF $\text{ips3}=2.8$ THEN lulustepatwaktu

5. **Cluster** (Klaster)

2. Forecasting Harga Saham

Pengetahuan Berupa Pohon Keputusan

Contoh: Rekomendasi Main Golf

- **Input:**

Outlook	Temperature	Humidity	Windy	Play
Sunny	hot	high	false	no
Sunny	hot	high	true	no
Overcast	hot	high	false	yes
Rainy	mild	high	false	yes
Rainy	cool	normal	false	yes
Rainy	cool	normal	true	no
Overcast	cool	normal	true	yes
Sunny	mild	high	false	no
Sunny	cool	normal	false	yes
Rainy	mild	normal	false	yes
Sunny	mild	normal	true	yes
Overcast	mild	high	true	yes
Overcast	hot	normal	false	yes
Rainy	mild	high	true	no

- **Output (Rules):**

If outlook = sunny and humidity = high then play = no
If outlook = rainy and windy = true then play = no
If outlook = overcast then play = yes
If humidity = normal then play = yes
If none of the above then play = yes

Contoh: Rekomendasi Main Golf

- Output (Tree):

Contoh: Rekomendasi Contact Lens

- Input:

Age	Spectacle Prescription	Astigmatism	Tear Production Rate	Recommended Lenses
young	myope	no	reduced	none
young	myope	no	normal	soft
young	myope	yes	reduced	none
young	myope	yes	normal	hard
young	hypermetrope	no	reduced	none
young	hypermetrope	no	normal	soft
young	hypermetrope	yes	reduced	none
young	hypermetrope	yes	normal	hard
pre-presbyopic	myope	no	reduced	none
pre-presbyopic	myope	no	normal	soft
pre-presbyopic	myope	yes	reduced	none
pre-presbyopic	myope	yes	normal	hard
pre-presbyopic	hypermetrope	no	reduced	none
pre-presbyopic	hypermetrope	no	normal	soft

Pembelajaran dengan
Metode Asosiasi (*FP-Growth*)

Pengetahuan Berupa Aturan Asosiasi

Contoh Aturan Asosiasi

- Algoritma *association rule* (aturan asosiasi) adalah algoritma yang menemukan atribut yang “**muncul bersamaan**”
- Contoh, pada hari Kamis malam, 1000 pelanggan telah melakukan belanja di supermaret ABC, dimana:
 - 200 orang membeli **Sabun Mandi**
 - dari 200 orang yang membeli sabun mandi, 50 orangnya membeli **Fanta**
- Jadi, association rule menjadi, “**Jika membeli sabun mandi, maka membeli Fanta**”, dengan nilai **support** = $200/1000 = 20\%$ dan nilai **confidence** = $50/200 = 25\%$
- Algoritma association rule diantaranya adalah: **A priori algorithm, FP-Growth algorithm, GRI algorithm**

Insight Law (Data Mining Law 6)

Data mining amplifies perception in the business domain

- How does data mining produce insight? This law approaches the heart of data mining – **why it must be a business process and not a technical one**
 - **Business problems are solved by people**, not by algorithms
- The **data miner and the business expert “see” the solution** to a problem, that is the patterns in the domain that allow the business objective to be achieved
 - Thus data mining is, or **assists as part of, a perceptual process**
 - Data mining **algorithms reveal patterns that are not normally visible** to human perception
- Within the data mining process, the **human problem solver interprets the results of data mining algorithms and integrates them into their business understanding**

Metode Learning Algoritma Data Mining

1. Supervised Learning

- Pembelajaran dengan **guru**, data set memiliki **target/label/class**
- **Sebagian besar** algoritma data mining (estimation, prediction/forecasting, classification) adalah supervised learning
- Algoritma melakukan proses belajar berdasarkan **nilai dari variabel target** yang terasosiasi dengan nilai dari variable prediktor

Dataset dengan Class

Attribute/Feature/Dimension

Class/Label/Target

	Sepal Length (cm)	Sepal Width (cm)	Petal Length (cm)	Petal Width (cm)	Type

Nominal

Numerik

2. Unsupervised Learning

- Algoritma data mining mencari pola dari **semua variable (atribut)**
- Variable (atribut) yang menjadi **target/label/class tidak ditentukan (tidak ada)**
- Algoritma **clustering** adalah algoritma unsupervised learning

Dataset tanpa Class

Attribute/Feature/Dimension

	Sepal Length (cm)	Sepal Width (cm)	Petal Length (cm)	Petal Width (cm)
1	5.1	3.5	1.4	0.2
2	4.9	3.0	1.4	0.2

102	5.8	2.7	5.1	1.9
103	7.1	3.0	5.9	2.1

3. Semi-Supervised Learning

- Semi-supervised learning adalah metode data mining yang menggunakan **data dengan label dan tidak berlabel sekaligus** dalam proses pembelajarannya
- Data yang memiliki kelas digunakan untuk **membentuk model** (pengetahuan), data tanpa label digunakan untuk **membuat batasan** antara kelas

Metode Data Mining

1. Estimation (Estimasi):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

2. Forecasting (Prediksi/Peramalan):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

3. Classification (Klasifikasi):

Decision Tree (CART, ID3, C4.5, Credal DT, Credal C4.5, Adaptive Credal C4.5), Naive Bayes (NB), K-Nearest Neighbor (kNN), Linear Discriminant Analysis (LDA), Logistic Regression (LogR), etc

4. Clustering (Klastering):

K-Means, K-Medoids, Self-Organizing Map (SOM), Fuzzy C-Means (FCM), etc

5. Association (Asosiasi):

FP-Growth, A Priori, Coefficient of Correlation, Chi Square, etc

Output/Pola/Model/Knowledge

1. Formula/**Function** (Rumus atau Fungsi Regresi)

- $\text{WAKTU TEMPUH} = 0.48 + 0.6 \text{ JARAK} + 0.34 \text{ LAMPU} + 0.2 \text{ PESANAN}$

2. Decision **Tree** (Pohon Keputusan)

4. **Rule** (Aturan)

- IF $\text{ips3}=2.8$ THEN lulustepatwaktu

5. **Cluster** (Klaster)

Latihan

1. Sebutkan 5 peran utama data mining!
2. Jelaskan perbedaan estimasi dan forecasting!
3. Jelaskan perbedaan forecasting dan klasifikasi!
4. Jelaskan perbedaan klasifikasi dan klustering!
5. Jelaskan perbedaan klustering dan association!
6. Jelaskan perbedaan estimasi dan klasifikasi!
7. Jelaskan perbedaan estimasi dan klustering!
8. Jelaskan perbedaan supervised dan unsupervised learning!
9. Sebutkan tahapan utama proses data mining!

1.3 Sejarah dan Penerapan Data Mining

Evolution of Sciences

- Sebelum 1600: **Empirical science**
 - Disebut sains kalau bentuknya **kasat mata**
- 1600-1950: **Theoretical science**
 - Disebut sains kalau bisa **dibuktikan secara matematis** atau eksperimen
- 1950s-1990: **Computational science**
 - Seluruh disiplin ilmu bergerak ke **komputasi**
 - Lahirnya banyak **model komputasi**
- 1990-sekarang: **Data science**
 - Kultur manusia **menghasilkan data besar**
 - Kemampuan komputer untuk mengolah data besar
 - Datangnya **data mining** sebagai arus utama sains

(Jim Gray and Alex Szalay, The World Wide Telescope: An Archetype for Online Science, Communication of ACM, 45(11): 50-54, Nov. 2002)

Report: Why "Data Scientist" Is The Best Job To Pursue In 2016

 **Gregory Ferenstein**, CONTRIBUTOR
FULL BIO
Opinions expressed are solely his own.

(Ferenstein Wire) Data science jobs in America, a company review site's voluntary reviews of a company's massive database of a composite score of job openings, and career opportunities.

According to the report, a Data Scientist is an important job in 2016.

25 Best Jobs in America

2.5k Shares |    

Want a new job? Glassdoor is here to help, identifying the 25 Best Jobs in America for 2016. The jobs that make this list have the highest overall Glassdoor Job Score, determined by combining three key factors – number of job openings, salary and career opportunities rating. These jobs stand out across all three categories.

Social Good/Non-profit (3)	1.4%	

Data Mining Use Cases across Industries

Machine learning has broad potential across industries and use cases

SOURCE: McKinsey Global Institute analysis

Business

Knowledge

Methods

Technology

Business Goals Law (Data Mining Law 1)

Business objectives are the origin of every data mining solution

- This defines the field of data mining: data mining is concerned with solving business problems and achieving business goals
- Data mining is not primarily a technology; it is a process, which has one or more business objectives at its heart
- Without a business objective, there is no data mining
- The maxim: “Data Mining is a Business Process”

Business Knowledge Law (Data Mining Law 2)

Business knowledge is central to every step of the data mining process

- A naive reading of CRISP-DM would see business knowledge used at the start of the process in defining goals, and at the end of the process in guiding deployment of results
- This would be to miss a key property of the data mining process, that business knowledge has a central role in every step

Private and Commercial Sector

- **Marketing:** product recommendation, market basket analysis, product targeting, customer retention
- **Finance:** investment support, portfolio management, price forecasting
- **Banking and Insurance:** credit and policy approval, money laundry detection
- **Security:** fraud detection, access control, intrusion detection, virus detection
- **Manufacturing:** process modeling, quality control, resource allocation
- **Web and Internet:** smart search engines, web marketing
- **Software Engineering:** effort estimation, fault prediction
- **Telecommunication:** network monitoring, customer churn prediction, user behavior analysis

Use Case: Product Recommendation

** Sistem Rekomendasi Promosi Produk **

Use Case: Software Fault Prediction

- The **cost of capturing and correcting defects** is expensive
 - \$14,102 per defect in post-release phase (Boehm & Basili 2008)
 - \$60 billion per year (NIST 2002)
- Industrial methods of manual software reviews activities can **find only 60% of defects** (Shull et al. 2002)
- The probability of detecting software fault prediction models is higher (71%) than software reviews (60%)

Public and Government Sector

- **Finance**: exchange rate forecasting, sentiment analysis
- **Taxation**: adaptive monitoring, fraud detection
- **Medicine and Health Care**: hypothesis discovery, disease prediction and classification, medical diagnosis
- **Education**: student allocation, resource forecasting
- **Insurance**: worker's compensation analysis
- **Security**: bomb, iceberg detection
- **Transportation**: simulation and analysis, load estimation
- **Law**: legal patent analysis, law and rule analysis
- **Politic**: election prediction

Contoh Penerapan Data Mining

- Penentuan **kelayakan kredit pemilihan rumah** di bank
- Penentuan **pasokan listrik PLN** untuk wilayah Jakarta
- Prediksi **profile tersangka koruptor** dari data pengadilan
- Perkiraan **harga saham** dan tingkat inflasi
- Analisis **pola belanja pelanggan**
- Memisahkan **minyak mentah dan gas alam**
- Penentuan **pola pelanggan yang loyal** pada perusahaan operator telepon
- Deteksi **pencucian uang** dari transaksi perbankan
- **Deteksi serangan** (*intrusion*) pada suatu jaringan

1. Himpunan Data (Dataset)

- Atribut adalah **faktor atau parameter yang menyebabkan** class/label/target terjadi
- Jenis dataset ada dua: **Private** dan **Public**
- **Private Dataset**: data set dapat diambil dari organisasi yang kita jadikan obyek penelitian
 - Bank, Rumah Sakit, Industri, Pabrik, Perusahaan Jasa, etc
- **Public Dataset**: data set dapat diambil dari repositori publik yang disepakati oleh para peneliti data mining
 - **UCI Repository** (<http://www.ics.uci.edu/~mlearn/MLRepository.html>)
 - **ACM KDD Cup** (<http://www.sigkdd.org/kddcup/>)
 - **PredictionIO** (<http://docs.prediction.io/datacollection/sample/>)
- Trend penelitian data mining saat ini adalah menguji metode yang dikembangkan oleh peneliti dengan public dataset, sehingga penelitian dapat bersifat: **comparable**, **repeatable** dan **verifiable**

2. Metode Data Mining

1. Estimation (Estimasi):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

2. Forecasting (Prediksi/Peramalan):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

3. Classification (Klasifikasi):

Decision Tree (CART, ID3, C4.5, Credal DT, Credal C4.5, Adaptive Credal C4.5), Naive Bayes (NB), K-Nearest Neighbor (kNN), Linear Discriminant Analysis (LDA), Logistic Regression (LogR), etc

4. Clustering (Klastering):

K-Means, K-Medoids, Self-Organizing Map (SOM), Fuzzy C-Means (FCM), etc

5. Association (Asosiasi):

FP-Growth, A Priori, Coefficient of Correlation, Chi Square, etc

3. Pengetahuan (Pola/Model)

1. Formula/**Function** (Rumus atau Fungsi Regresi)

- $\text{WAKTU TEMPUH} = 0.48 + 0.6 \text{ JARAK} + 0.34 \text{ LAMPU} + 0.2 \text{ PESANAN}$

2. Decision **Tree** (Pohon Keputusan)

3. Tingkat **Korelasi**

4. **Rule** (Aturan)

- IF $\text{ips3}=2.8$ THEN lulustepatwaktu

5. **Cluster** (Klaster)

4. Evaluasi (Akurasi, Error, etc)

1. Estimation:

Error: Root Mean Square Error (RMSE), MSE, MAPE, etc

2. Prediction/**Forecasting** (Prediksi/Peramalan):

Error: Root Mean Square Error (RMSE) , MSE, MAPE, etc

3. Classification:

Confusion Matrix: Accuracy

ROC Curve: Area Under Curve (AUC)

4. Clustering:

Internal Evaluation: Davies–Bouldin index, Dunn index,

External Evaluation: Rand measure, F-measure, Jaccard index,
Fowlkes–Mallows index, Confusion matrix

5. Association:

Lift Charts: Lift Ratio

Precision and Recall (F-measure)

Kriteria Evaluasi dan Validasi Model

1. Akurasi

- Ukuran dari **seberapa baik model** mengkorelasikan antara hasil dengan atribut dalam data yang telah disediakan
- Terdapat berbagai **model akurasi**, tetapi semua model akurasi tergantung pada data yang digunakan

2. Kehandalan

- Ukuran di mana model data mining diterapkan pada **dataset yang berbeda**
- Model data mining dapat diandalkan jika menghasilkan **pola umum yang sama** terlepas dari data testing yang disediakan

3. Kegunaan

- Mencakup berbagai metrik yang mengukur apakah model tersebut memberikan **informasi yang berguna**

Keseimbangan diantaranya ketiganya diperlukan karena belum tentu model yang akurat adalah handal, dan yang handal atau akurat belum tentu berguna

Magic Quadrant for Data Science Platform

(Gartner, 2017)

Magic Quadrant for Data Science Platform

(Gartner, 2018)

KNIME

The screenshot displays the KNIME Analytics Platform interface. The main workspace shows a workflow with two nodes: "Excel Reader (XLS)" (Node 1) and "Decision Tree Learner" (Node 2). The left sidebar contains a file explorer and a node repository. The right sidebar shows a detailed view of the "Decision Tree View - 0:2 - Decision Tree Learner".

The decision tree structure is as follows:

- Root Node: "yes (9/14)"
 - Left Branch: "no (2/2)"
 - Table:

Category	%	n
no	100.0	2
yes	0.0	0
Total	14.3	2
 - Right Branch: "yes (9/12)"
 - Table:

Category	%	n
no	25.0	3
yes	75.0	9
Total	85.7	12
 - Split on "Temperature"
 - Left Branch: "yes (5/8)"
 - Table:

Category	%	n
yes	100.0	5
no	0.0	0
Total	12.5	5
 - Right Branch: "yes (4/4)"
 - Table:

Category	%	n
yes	100.0	4
no	0.0	0
Total	100.0	4

Log file is located at: C:\Users\romis\knome-workspace\.metadata\knome\knome...

Rapidminer

The screenshot displays the RapidMiner Studio Educational 9.6.000 interface. The main workspace shows a workflow with two processes: 'Retrieve Golf' and 'Decision Tree'. The 'Decision Tree' process is highlighted, and its parameters are visible on the right. The 'Parameters' panel for the 'Decision Tree' process shows the following settings:

- Criterion: gain_ratio
- Maximal depth: 10
- Apply pruning: ☒
- Confidence: 0.1
- Apply prepruning: ☒

A pop-up window titled 'Tree (Decision Tree)' displays the resulting decision tree structure:

```
graph TD
    Outlook -- overcast --> yes1[yes]
    Outlook -- rain --> Wind
    Outlook -- sunny --> Humidity
    Wind -- false --> yes2[yes]
    Wind -- true --> no1[no]
    Humidity -- "> 77.500 & 77.500" --> no2[no]
    Humidity -- "> 77.500 & 77.500" --> yes3[yes]
```

The decision tree structure is as follows:

- Outlook
 - overcast: yes
 - rain: Wind
 - false: yes
 - true: no
 - sunny: Humidity
 - > 77.500 & 77.500: no
 - > 77.500 & 77.500: yes

Rapidminer

- Pengembangan dimulai pada 2001 oleh **Ralf Klinkenberg**, **Ingo Mierswa**, dan **Simon Fischer** di Artificial Intelligence Unit dari University of Dortmund, ditulis dalam bahasa **Java**

- Open source berlisensi **AGPL** (GNU Affero General Public License) versi 3
- Meraih penghargaan sebagai **software data mining dan data analytics terbaik** di berbagai lembaga kajian, termasuk IDC, Gartner, KDnuggets, dsb

Fitur Rapidminer

- Mendukung proses dan metode **data mining**: ETL (**extraction, transformation, loading**), data preprocessing, visualisasi, modelling dan evaluasi
- Proses data mining tersusun atas **operator-operator yang nestable**, dideskripsikan dengan XML, dan dibuat dengan GUI
- Meng**integrasikan** berbagai tools data mining lain termasuk Weka, R, Hadoop, Python, dsb
- Dukungan **Format data**: Oracle, IBM DB2, Microsoft SQL Server, MySQL, PostgreSQL, Ingres, Excel, Access, SPSS, CSV files dan berbagai format lain

Atribut Pada Rapidminer

1. **Atribut**: karakteristik atau fitur dari data yang menggambarkan sebuah proses atau situasi
 - ID, atribut biasa
2. **Atribut target**: atribut yang menjadi tujuan untuk diisi oleh proses data mining
 - Label, cluster, weight

Tipe Nilai Atribut pada Rapidminer

1. **nominal**: nilai secara kategori
2. **binominal**: nominal dua nilai
3. **polynominal**: nominal lebih dari dua nilai
4. **numeric**: nilai numerik secara umum
5. **integer**: bilangan bulat
6. **real**: bilangan nyata
7. **text**: teks bebas tanpa struktur
8. **date_time**: tanggal dan waktu
9. **date**: hanya tanggal
10. **time**: hanya waktu

Perspektif dan View

1. Perspektif **Selamat Datang**
(**Welcome** perspective)
2. Perspektif **Desain**
(**Design** perspective)
3. Perspektif **Hasil**
(**Result** perspective)

Perspektif Desain

- Pindah ke **Perspektif Desain** dengan Klik:

View Operator

- **Process Control**
Untuk **mengontrol aliran** proses, seperti *loop* atau *conditional branch*
- **Utility**
Untuk mengelompokkan *subprocess*, juga *macro* dan *logger*
- **Repository Access**
Untuk membaca dan **menulis repositori**
- **Import**
Untuk **membaca data** dari berbagai **format** eksternal
- **Export**
Untuk **menulis data** ke berbagai **format** eksternal
- **Data Transformation**
Untuk **transformasi data** dan metadata
- **Modelling**
Untuk **proses data mining** seperti klasifikasi, regresi, clustering, asosiasi, dll
- **Evaluation**
Untuk mengukur **kualitas dan perfomansi** dari model

View Proses

Operator dan Proses

- Proses data mining pada dasarnya adalah proses analisis yang berisi **alur kerja dari komponen data mining**
- Komponen dari proses ini disebut **operator**, yang memiliki:

1. **Input**
2. **Output**
3. **Aksi** yang dilakukan
4. **Parameter** yang diperlukan

- Sebuah operator bisa disambungkan melalui **port masukan** (kiri) dan **port keluaran** (kanan)
- Indikator status** dari operator:
 - Lampu** status: **merah** (tak tersambung), **kuning** (lengkap tetapi belum dijalankan), **hijau** (sudah berhasil dijalankan)
 - Segitiga** warning: bila **ada pesan** status
 - Breakpoint**: bila ada breakpoint sebelum/sesudahnya
 - Comment**: bila ada **komentar**

View Parameter

- Operator kadang memerlukan **parameter untuk bisa berfungsi**
- Setelah **operator dipilih** di view Proses, parameternya ditampilkan di view ini

Process

Process

Synopsis

The root operator which is the outer most operator of every process.

Description

Each process must contain exactly one operator of this class, and it must be the root operator of the process. This operator provides a set of parameters that are of global relevance to the process like

Mendesain Proses

Kumpulan dan **rangkaian fungsi-fungsi (operator)** yang bisa disusun secara visual (visual programming)

Menjalankan Proses

Proses dapat dijalankan dengan:

- Menekan tombol **Play**
- Memilih menu **Process** → **Run**
- Menekan kunci **F11**

2.2 Penerapan Proses Data Mining

Proses Data Mining

Latihan: Rekomendasi Main Golf

1. Lakukan **training** pada data golf (**ambil dari repositories rapidminer**) dengan menggunakan algoritma **decision tree**
2. Tampilkan **himpunan data** (dataset) dan **pengetahuan** (model tree) yang terbentuk

 **LEARN**

 **NEW PROCESS**

 **OPEN PROCESS**

Choose a template to start from:

Blank

Start with a blank process.

Churn Modeling

Predict which of your customers will churn and why with an optimized decision tree.

Direct Marketing

Predict response to campaigns and increase the conversion rate of your campaign.

Credit Risk Modeling

Model credit default risk by training an optimized Support Vector Machine (SVM) model.

Market Basket Analysis

Find products frequently purchased together and turn them into rules for recommendations.

Predictive Maintenance

Model equipment failures to schedule maintenance pre-emptively.

Price Risk Clustering

Cluster price developments using X-Means to unveil price-risk-relationships.

Lift Chart

Create a lift chart to visualize the improvement that a model provides compared to guessing.

Data import wizard - Step 4 of 4

This wizard guides you to import your data.
Step 4: RapidMiner Studio uses strongly typed attributes. In this step, you can define the data types of your attributes. Furthermore, RapidMiner Studio assigns roles to the attributes, defining what they can be used for by the individual operators. These roles can be also defined here. Finally, you can rename attributes or deselect them entirely.

Latihan: Prediksi Elektabilitas Caleg

1. Lakukan **training** pada data pemilu (**datapemilukpu.xls**) dengan **algoritma yang tepat**
2. Data bisa ditarik dari Import Data atau operator Read Excel
3. Tampilkan **himpunan data** (dataset) dan **pengetahuan** (pola/model) yang terbentuk
4. Gunakan model yang dihasilkan untuk memprediksi **datapemilukpu-testing.xls**

Proses Prediksi Elektabilitas Caleg

Latihan: Estimasi Konsumsi Minyak

1. Lakukan training pada data konsumsi minyak (**HeatingOil.csv**)
 - Dataset **jumlah konsumsi minyak untuk alat pemanas ruangan** di rumah pertahun perrumah
 - Atribut:
 - **Insulation**: Ketebalan insulasi rumah
 - **Temperatur**: Suhu udara sekitar rumah
 - **Heating Oil**: Jumlah konsumsi minyak pertahun perrumah
 - **Number of Occupant**: Jumlah penghuni rumah
 - **Average Age**: Rata-rata umur penghuni rumah
 - **Home Size**: Ukuran rumah
2. Gunakan operator **Set Role** untuk memilih Label (Heating Oil), tidak langsung dipilih pada saat Import Data
3. Pilih **metode yang tepat** supaya menghasilkan model
4. Apply model yang dihasilkan ke data pelanggan baru di file **HeatingOil-Scoring.csv**, supaya kita bisa mengestimasi berapa kebutuhan konsumsi minyak mereka, untuk mengatur stok penjualan minyak

Proses Estimasi Konsumsi Minyak

Latihan: Matrix Correlation Konsumsi Minyak

1. Lakukan training pada data konsumsi minyak (**HeatingOil.csv**)
 - Dataset **jumlah konsumsi minyak untuk alat pemanas ruangan** di rumah pertahun perrumah
 - Atribut:
 - **Insulation**: Ketebalan insulasi rumah
 - **Temperatur**: Suhu udara sekitar rumah
 - **Heating Oil**: Jumlah konsumsi minyak pertahun perrumah
 - **Number of Occupant**: Jumlah penghuni rumah
 - **Average Age**: Rata-rata umur penghuni rumah
 - **Home Size**: Ukuran rumah
2. Tujuannya ingin mendapatkan informasi tentang **atribut apa saja yang paling berpengaruh pada konsumsi minyak**

Window size = 6
Step size = 1
Horizon = 1

Using data from 6 rows (Jan 2009 – Jun 2009) of the window, a learner can be trained to predict the label which is the value of the time series in the next time step (Jul 2009) and so on.

Parameter dari Windowing

- **Window size**: Determines how many “attributes” are created for the cross-sectional data
 - Each row of the original time series within the window width will become a new attribute
 - We choose $w = 6$
- **Step size**: Determines how to advance the window
 - Let us use $s = 1$
- **Horizon**: Determines how far out to make the forecast
 - If the window size is 6 and the horizon is 1, then the seventh row of the original time series becomes the first sample for the “label” variable
 - Let us use $h = 1$

Latihan

- Lakukan training dengan menggunakan **linear regression** pada dataset **hargasaham-training-uni.xls**
- Gunakan Split Data untuk memisahkan dataset di atas, 90% training dan 10% untuk testing
- Harus dilakukan proses **Windowing** pada dataset
- **Plot grafik** antara label dan hasil prediksi dengan menggunakan chart

Latihan: Penentuan Kelayakan Kredit

1. Lakukan training dengan algoritma yang tepat pada dataset: **creditapproval-training.xls**
2. Ujicoba model yang dibentuk dari training di atas ke dataset di bawah: **creditapproval-testing.xls**

Latihan: Deteksi Kanker Payudara

1. Lakukan training pada data kanker payudara (**breasttissue.xls**)
2. **Dataset adalah di sheet 2**, sedangkan sheet 1 berisi penjelasan tentang data
3. Bagi dataset dengan menggunakan operator **Split Data**, 90% untuk training dan 10% untuk testing
4. Pilih metode yang tepat supaya menghasilkan pola, analisis pola yang dihasilkan

Latihan: Deteksi Serangan Jaringan

1. Lakukan training pada data serangan jaringan (**intrusion-training.xls**)
2. Pilih metode yang tepat supaya menghasilkan pola

Latihan: Klasifikasi Resiko Kredit

1. Lakukan training pada data resiko kredit
(**CreditRisk.csv**)
(<http://romisatriawahono.net/lecture/dm/dataset/>)
2. Pilih metode yang tepat supaya menghasilkan pola

Latihan: Klasifikasi Music Genre

1. Lakukan training pada data Music Genre (**musicgenre-small.csv**)
2. Pilih metode yang tepat supaya menghasilkan pola

Competency Check

1. Dataset – Methods – Knowledge

1. Dataset Main Golf (Klasifikasi)
2. Dataset Iris (Klasifikasi)
3. Dataset Iris (Klastering)
4. Dataset CPU (Estimasi)
5. Dataset Pemilu (Klasifikasi)
6. Dataset Heating Oil (Asosiasi, Estimasi)
7. Dataset Transaksi (Association)
8. Dataset Harga Saham (Forecasting) (Uni dan Multi)

Tugas: Mencari dan Mengolah Dataset

- Pahami **berbagai dataset** yang ada di folder dataset
- Gunakan rapidminer untuk mengolah **dataset** tersebut sehingga menjadi **pengetahuan**
- Pilih **algoritma yang sesuai** dengan jenis data pada dataset

Tugas: Menguasai Satu Metode DM

1. Pahami dan kuasai **satu metode data mining** dari berbagai literature:
 1. Naïve Bayes
 2. k Nearest Neighbor
 3. k-Means
 4. C4.5
 5. Neural Network
 6. Logistic Regression
 7. FP Growth
 8. Fuzzy C-Means
 9. Self-Organizing Map
 0. Support Vector Machine
2. **Rangkumkan dengan detail dalam bentuk slide**, dengan format:
 1. Definisi
 2. Tahapan Algoritma (lengkap dengan formulanya)
 3. Penerapan Tahapan Algoritma untuk Studi Kasus Dataset Main Golf, Iris, Transaksi, CPU, dsb
(hitung manual (gunakan excel) dan **tidak dengan menggunakan rapidminer**, harus sinkron dengan tahapan algoritma)
3. **Presentasikan** di depan kelas pada mata kuliah berikutnya dengan **bahasa manusia yang baik dan benar**

Tugas: Kembangkan Code dari Algoritma DM

1. Kembangkan **Java Code** dari algoritma yang dipilih
2. Gunakan **hanya 1 class (file)** dan beri nama sesuai nama algoritma, boleh membuat banyak method dalam class tersebut
3. **Buat account** di Trello.Com dan register ke <https://trello.com/b/ZOwroEYg/course-assignment>
4. **Buat card** dengan nama sendiri dan **upload semua file** (pptx, xlsx, pdf, etc) laporan ke card tersebut
5. **Deadline**: sehari sebelum pertemuan berikutnya

Algoritma k-Means

Format Template Tugas

Definisi

- K-means adalah (John, 2016)

Tahapan Algoritma k-Means

1. Siapkan dataset
2. Tentukan A dengan rumus $A = x + y$
3. Tentukan B dengan rumus $B = d + e$
4. Ulangi proses 1-2-3 sampai tidak ada perubahan

1. Siapkan dataset

2. Tentukan A

- blablabla

3. Tentukan B

- blablabla

4. Iterasi 1

- blablabla

4. Iterasi 2 ... dst

- blablabla

2.3 Evaluasi Model Data Mining

Proses Data Mining

$$\forall a \in \mathbb{R} \text{ such that } y = a \text{ if } x = f(x) - f(a)$$

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f\left(a + \frac{b-a}{n} \cdot k\right) \cdot \frac{b-a}{n}$$

$$- \left(-m_2 x \tan(\theta) \right) \Big|_l = \frac{r^2}{4l} + \left(\cos(\omega t) + \frac{r}{4l} \cos(2\omega t) \right)$$

$$+ R_1 g \left(-\zeta + \sqrt{\zeta^2 - 1} \right) \ln J + R_2 g \left(-\zeta - \sqrt{\zeta^2 - 1} \right) \ln J$$

$$w_p = \left[\int_0^1 dx = \frac{2.27}{0^2} \right] ; z dx = \left(\frac{87}{0^2} \right) \cdot (h_2^2 - 1)$$

1. Himpunan Data

Evaluasi Model Data Mining

1. Estimation:

- **Error:** Root Mean Square Error (RMSE), MSE, MAPE, etc

2. Prediction/**Forecasting** (Prediksi/Peramalan):

- **Error:** Root Mean Square Error (RMSE) , MSE, MAPE, etc

3. Classification:

- **Confusion Matrix:** Accuracy
- **ROC Curve:** Area Under Curve (AUC)

4. Clustering:

- **Internal Evaluation:** Davies–Bouldin index, Dunn index,
- **External Evaluation:** Rand measure, F-measure, Jaccard index, Fowlkes–Mallows index, Confusion matrix

5. Association:

- **Lift Charts:** Lift Ratio
- **Precision and Recall** (F-measure)

Evaluasi Model Data Mining

- Pembagian dataset, perbandingan 90:10 atau 80:20:
 - Data **Training**
 - Data **Testing**
- Data **training untuk pembentukan model**, dan data **testing digunakan untuk pengujian model**
- Pemisahan data training dan testing
 1. Data dipisahkan secara **manual**
 2. Data dipisahkan otomatis dengan operator **Split Data**
 3. Data dipisahkan otomatis dengan **X Validation**

2.3.1 Pemisahan Data Manual

Latihan: Penentuan Kelayakan Kredit

- Gunakan **dataset** di bawah:
 - [creditapproval-training.xls](#): untuk membuat model
 - [creditapproval-testing.xls](#): untuk menguji model
- Data di atas terpisah dengan perbandingan: **data testing** (10%) dan **data training** (90%)
- Data training sebagai pembentuk model, dan data testing untuk pengujian model, **ukur performancinya**

Confusion Matrix → Accuracy

accuracy: 90.00%

	true MACET	true LANCAR	class precision
pred. MACET	53	4	92.98%
pred. LANCAR	6	37	86.05%
class recall	89.83%	90.24%	

- pred MACET- true MACET: Jumlah data yang diprediksi macet dan kenyataannya macet (**TP**)
- pred LANCAR-true LANCAR: Jumlah data yang diprediksi lancar dan kenyataannya lancar (**TN**)
- pred MACET-true LANCAR: Jumlah data yang diprediksi macet tapi kenyataannya lancar (**FP**)
- pred LANCAR-true MACET: Jumlah data yang diprediksi lancar tapi kenyataannya macet (**FN**)

$$\text{Accuracy} = \frac{\text{TP} + \text{TN}}{\text{TP} + \text{TN} + \text{FP} + \text{FN}} = \frac{53 + 37}{53 + 37 + 4 + 6} = \frac{90}{100} = 90\%$$

Precision and Recall, and F-measures

- **Precision**: **exactness** – what % of tuples that the classifier labeled as positive are actually positive

$$precision = \frac{TP}{TP + FP}$$

- **Recall**: **completeness** – what % of positive tuples did the classifier label as positive?

$$recall = \frac{TP}{TP + FN}$$

- Perfect score is 1.0
- Inverse relationship between precision & recall

- **F measure** (F1 or F-score): **harmonic mean** of precision and recall,

$$F = \frac{2 \times precision \times recall}{precision + recall}$$

- **F_β** : **weighted measure** of precision and recall

- assigns β times as much weight to recall as to precision

$$F_\beta = \frac{(1 + \beta^2) \times precision \times recall}{\beta^2 \times precision + recall}$$

Sensitivity and Specificity

Binary classification should be both **sensitive and specific as much as possible**:

1. **Sensitivity** measures the proportion of true 'positives' that are correctly identified (**True Positive Rate (TP Rate) or Recall**)

$$\text{Sensitivity} = \frac{\text{Number of 'True Positives'}}{\text{Number of 'True Positives' + Number of 'False Negatives'}}$$

2. **Specificity** measures the proportion of true 'negatives' that are correctly identified (**False Negative Rate (FN Rate) or Precision**)

$$\text{Specificity} = \frac{\text{Number of 'True Negatives'}}{\text{Number of 'True Negatives' + Number of 'False Positives'}}$$

PPV and NPV

We need to know the **probability that the classifier will give the correct diagnosis**, but the sensitivity and specificity do not give us this information

- **Positive Predictive Value (PPV)** is the proportion of cases with 'positive' test results that are correctly diagnosed

$$PPV = \frac{\text{Number of 'True Positives'}}{\text{Number of 'True Positives' + Number of 'False Positives'}}$$

- **Negative Predictive Value (NPV)** is the proportion of cases with 'negative' test results that are correctly diagnosed

$$NPV = \frac{\text{Number of 'True Negatives'}}{\text{Number of 'True Negatives' + Number of 'False Negatives'}}$$

Kurva ROC - AUC (Area Under Curve)

- ROC (Receiver Operating Characteristics) curves: for **visual comparison of classification models**
 - Originated from **signal detection theory**
- ROC curves are two-dimensional graphs in which the **TP rate is plotted on the Y-axis** and the **FP rate is plotted on the X-axis**
- ROC curve depicts relative **trade-offs between benefits** ('true positives') and **costs** ('false positives')
- Two types of ROC curves: **discrete** and **continuous**

Kurva ROC - AUC (Area Under Curve)

Guide for Classifying the AUC

1. $0.90 - 1.00$ = **excellent** classification
2. $0.80 - 0.90$ = **good** classification
3. $0.70 - 0.80$ = **fair** classification
4. $0.60 - 0.70$ = **poor** classification
5. $0.50 - 0.60$ = failure

(Gorunescu, 2011)

Latihan: Prediksi Kanker Payudara

- Gunakan dataset: **breasttissue.xls**
- Split data dengan perbandingan:
data testing (10%) dan **data training** (90%)
- Ukur performance
(Accuracy dan **Kappa**)

Kappa Statistics

- The (Cohen's) Kappa statistics is a more vigorous measure than the 'percentage correct prediction' calculation, because Kappa considers the **correct prediction that is occurring by chance**
- Kappa is essentially a measure of how well the classifier performed as compared to how well it would have performed simply by chance
- A model has a **high Kappa score** if there is a big difference between the accuracy and the null error rate (Markham, K., 2014)
- Kappa is an important measure on classifier performance, especially on **imbalanced data set**

Latihan: Prediksi Harga Saham

- Gunakan **dataset** di bawah:
 - [hargasaham-training.xls](#): untuk membuat model
 - [hargasaham-testing.xls](#): untuk menguji model
- Data di atas terpisah dengan perbandingan: **data testing** (10%) dan **data training** (90%)
- Jadikan data training sebagai pembentuk model/pola/knowledge, dan data testing untuk pengujian model
- Ukur performance

Close prediction(Close)

Root Mean Square Error

- The square root of the **mean/average of the square of all of the error**

$$\text{RMSE} = \sqrt{\frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2}$$

- The use of RMSE is very common and it makes an excellent general purpose **error metric for numerical predictions**
- To construct the RMSE, we first need to **determine the residuals**
 - Residuals are the **difference between the actual values and the predicted** values
 - We denoted them by $\hat{y}_i - y_i$
 - where y_i is the **observed value for the i th observation** and
 - $\hat{y}_i$ is the **predicted value**
- They **can be positive or negative** as the predicted value under or over estimates the actual value
- You then use the RMSE as a **measure of the spread of the y values about the predicted y value**

Latihan: Klastering Jenis Bunga Iris

1. Lakukan **training** pada data iris (**ambil dari repositories rapidminer**) dengan menggunakan algoritma clustering **k-means**
2. Ukur performance-nya dengan **Cluster Distance Performance**, cek dan analisis nilai yang keluar **Davies Bouldin Indeks (DBI)**
3. Lakukan **pengubahan pada nilai k** pada parameter k-means dengan memasukkan **nilai: 3, 4, 5, 6, 7**

k	DBI
3	0.666
4	0.764
5	0.806
6	0.910
7	0.999

Davies–Bouldin index (DBI)

- The Davies–Bouldin index (DBI) (introduced by David L. Davies and Donald W. Bouldin in 1979) is a **metric for evaluating clustering algorithms**
- This is an internal evaluation scheme, where the validation of **how well the clustering has been done** is made using quantities and features inherent to the dataset
- As a function of the ratio of the within cluster scatter, to the between cluster separation, a **lower value will mean that the clustering is better**
- This affirms the idea that no cluster has to be similar to another, and hence the best clustering scheme essentially minimizes the Davies–Bouldin index
- This index thus defined is an average over all the i clusters, and hence a good measure of deciding how many clusters actually exists in the data is to plot it against the number of clusters it is calculated over
- The number i for which this value is **the lowest is a good measure** of the number of clusters the data could be ideally classified into

2.3.2 Pemisahan Data Otomatis dengan Operator *Split Data*

Split Data Otomatis

- The **Split Data** operator takes a dataset as its input and delivers the subsets of that dataset through its output ports
- The **sampling type parameter** decides how the examples should be shuffled in the resultant partitions:
 1. **Linear sampling**: Divides the dataset into partitions **without changing the order** of the examples
 2. **Shuffled sampling**: Builds **random subsets** of the dataset
 3. **Stratified sampling**: Builds **random** subsets and ensures that the **class distribution in the subsets is the same as in the whole dataset**

Latihan: Prediksi Kelulusan Mahasiswa

1. Dataset: [datakelulusanmahasiswa.xls](#)
2. Pisahkan data menjadi dua secara otomatis (**Split Data**): **data testing** (10%) dan **data training** (90%)
3. Ujicoba parameter pemisahan data baik menggunakan **Linear Sampling**, **Shuffled Sampling** dan **Stratified Sampling**
4. Jadikan data training sebagai pembentuk model/pola/knowledge, dan data testing untuk pengujian model
5. Terapkan **algoritma yang sesuai** dan **ukur performance** dari model yang dibentuk

Proses Prediksi Kelulusan Mahasiswa

Latihan: Estimasi Konsumsi Minyak

1. Dataset: [HeatingOil.csv](#)
2. Pisahkan data menjadi dua secara otomatis ([Split Data](#)): **data testing** (10%) dan **data training** (90%)
3. Jadikan data training sebagai pembentuk model/pola/knowledge, dan data testing untuk pengujian model
4. Terapkan algoritma yang sesuai dan ukur performance dari model yang dibentuk

2.3.3 Pemisahan Data dan Evaluasi Model Otomatis dengan *Cross-Validation*

Metode Cross-Validation

- Metode cross-validation digunakan untuk **menghindari overlapping** pada data testing
- **Tahapan** cross-validation:
 1. Bagi data menjadi **k subset** yg berukuran sama
 2. Gunakan **setiap subset untuk data testing** dan sisanya untuk data training
- Disebut juga dengan **k-fold cross-validation**
- Seringkali subset dibuat stratified (bertingkat) sebelum cross-validation dilakukan, karena **stratifikasi akan mengurangi variansi** dari estimasi

10 Fold Cross-Validation

Eksperimen	Dataset										Akurasi
1	Orange	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	93%
2	Light Gray	Orange	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	91%
3	Light Gray	Light Gray	Orange	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	90%
4	Light Gray	Light Gray	Gray	Orange	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	93%
5	Light Gray	Light Gray	Gray	Light Gray	Orange	Light Gray	Gray	Light Gray	Gray	Light Gray	93%
6	Light Gray	Light Gray	Gray	Light Gray	Gray	Orange	Gray	Light Gray	Gray	Light Gray	91%
7	Light Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Orange	Light Gray	Gray	Light Gray	94%
8	Light Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Orange	Gray	Light Gray	93%
9	Light Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Orange	Light Gray	91%
10	Light Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Light Gray	Gray	Orange	90%
Akurasi Rata-Rata											92%

Orange: k-subset (data testing)

10 Fold Cross-Validation

- Metode evaluasi standard: **stratified 10-fold cross-validation**
- Mengapa **10**? Hasil dari berbagai percobaan yang ekstensif dan pembuktian teoritis, menunjukkan bahwa **10-fold cross-validation adalah pilihan terbaik** untuk mendapatkan hasil validasi yang akurat
- 10-fold cross-validation akan **mengulang pengujian sebanyak 10 kali** dan hasil pengukuran adalah nilai rata-rata dari 10 kali pengujian

Latihan: Prediksi Elektabilitas Caleg

1. Lakukan **training** pada data pemilu ([datapemilukpu.xls](#))
2. Lakukan **pengujian** dengan menggunakan 10-fold X Validation
3. Ukur **performance**-nya dengan confusion matrix dan ROC Curve
4. Lakukan ujicoba, ubah algoritma menjadi **Naive Bayes**, **k-NN**, **Random Forest** (RF), **Logistic Regression** (LogR), analisis mana algoritma yang menghasilkan model yang lebih baik (akurasi tinggi)

	C4.5	NB	k-NN
Accuracy	92.87%	79.34%	88.7%
AUC	0.934	0.849	0.5

Latihan: Komparasi Prediksi Harga Saham

- Gunakan dataset **harga saham** ([hargasaham-training.xls](#))
- Lakukan pengujian dengan 10-fold X Validation
- Lakukan ujicoba dengan **mengganti algoritma** (GLM, LR, NN, DL, SVM), **catat hasil RMSE** yang keluar

2.3.4 Komparasi Algoritma Data Mining

Metode Data Mining

1. Estimation (Estimasi):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

2. Forecasting (Prediksi/Peramalan):

Linear Regression (LR), Neural Network (NN), Deep Learning (DL), Support Vector Machine (SVM), Generalized Linear Model (GLM), etc

3. Classification (Klasifikasi):

Decision Tree (CART, ID3, C4.5, Credal DT, Credal C4.5, Adaptive Credal C4.5), Naive Bayes (NB), K-Nearest Neighbor (kNN), Linear Discriminant Analysis (LDA), Logistic Regression (LogR), etc

4. Clustering (Klastering):

K-Means, K-Medoids, Self-Organizing Map (SOM), Fuzzy C-Means (FCM), etc

5. Association (Asosiasi):

FP-Growth, A Priori, Coefficient of Correlation, Chi Square, etc

Latihan: Prediksi Elektabilitas Caleg

1. Lakukan **training** pada data pemilu ([datapemilukpu.xls](#)) dengan menggunakan algoritma
 1. Decision Tree (C4.5)
 2. Naïve Bayes (NB)
 3. K-Nearest Neighbor (K-NN)
2. Lakukan **pengujian** dengan menggunakan 10-fold X Validation

	DT	NB	K-NN
Accuracy	92.45%	77.46%	88.72%

- NN
- DL dan SVM

Analisis Statistik

1. Statistik Deskriptif

- Nilai **mean** (rata-rata), standar deviasi, varians, data maksimal, data minimal, dsb

2. Statistik Inferensi

- Perkiraan dan estimasi
- Pengujian **Hipotesis**

Statistik Inferensi (Pengujian Hipotesis)

Penggunaan	Parametrik	Non Parametrik
Dua sampel saling berhubungan (<i>Two Dependent samples</i>)	T Test Z Test	Sign test Wilcoxon Signed-Rank Mc Nemar Change test
Dua sampel tidak berhubungan (<i>Two Independent samples</i>)	T Test Z Test	Mann-Whitney U test Moses Extreme reactions Chi-Square test Kolmogorov-Smirnov test Walt-Wolfowitz runs
Beberapa sampel berhubungan (<i>Several Dependent Samples</i>)		Friedman test Kendall W test Cochran's Q
Beberapa sampel tidak Berhubungan (<i>Several Independent Samples</i>)	Anova test (F test)	Kruskal-Wallis test Chi-Square test Median test

Metode Parametrik

- Metode parametrik dapat dilakukan jika beberapa **persyaratan dipenuhi**, yaitu:
 - Sampel yang dianalisis haruslah berasal dari **populasi yang berdistribusi normal**
 - Jumlah **data cukup banyak**
 - Jenis data yang dianalisis adalah biasanya **interval atau rasio**

Metode Non Parametrik

- Metode ini dapat dipergunakan secara lebih luas, karena **tidak mengharuskan datanya berdistribusi normal**
 - Dapat dipakai untuk **data nominal dan ordinal** sehingga sangat berguna bagi para peneliti sosial untuk meneliti perilaku konsumen, sikap manusia, dsb
 - Cenderung **lebih sederhana** dibandingkan dengan metode parametrik
- Selain keuntungannya, berikut **kelemahan metode non parametrik**:
 - **Tidak adanya sistematika yang jelas** seperti metode parametrik
 - Terlalu **sederhana** sehingga sering meragukan
 - Memakai **tabel-tabel yang lebih bervariasi** dibandingkan dengan tabel-tabel standar pada metode parametrik

Interpretasi Statistik

- H_0 = tidak ada perbedaan signifikan
- H_a = ada perbedaan signifikan

$\alpha = 0.05$

Bila $p < 0.05$, maka H_0 ditolak

- Contoh: kasus $p = 0.03$, maka dapat ditarik kesimpulan?

Latihan: Prediksi Kelulusan Mahasiswa

1. Lakukan **training** pada data mahasiswa ([datakelulusanmahasiswa.xls](#)) dengan menggunakan **C4.5**, **ID3**, **NB**, **K-NN**, **RF** dan **LogR**
2. Lakukan **pengujian** dengan menggunakan 10-fold X Validation
3. Uji beda dengan **t-Test** untuk mendapatkan model terbaik

Hasil Prediksi Kelulusan Mahasiswa

- Komparasi Accuracy dan AUC

	C4.5	NB	K-NN	LogR
Accuracy	91.55%	82.58%	83.63%	77.47%
AUC	0.909	0.894	0.5	0.721

- Uji Beda (t-Test)

	C4.5	NB	kNN	LogR
A	B	C	D	E
	0.916 +/- 0.039	0.826 +/- 0.085	0.836 +/- 0.060	0.775 +/- 0.185

Latihan: Klastering Jenis Bunga Iris

1. Lakukan **training** pada data iris (**ambil dari repositories rapidminer**) dengan menggunakan algoritma clustering **k-means**
2. Gunakan pilihan nilai untuk **k**, isikan dengan **3, 4, 5, 6, 7**
3. Ukur performance-nya dengan **Cluster Distance Performance**, dari **analisis Davies Bouldin Indeks (DBI)**, tentukan **nilai k yang paling optimal**

	k=3	k=4	k=5	k=6	k=7
DBI	0.666	0.764	0.806	0.910	0.99

Davies–Bouldin index (DBI)

- The Davies–Bouldin index (DBI) (introduced by David L. Davies and Donald W. Bouldin in 1979) is a **metric for evaluating clustering algorithms**
- This is an internal evaluation scheme, where the validation of **how well the clustering has been done** is made using quantities and features inherent to the dataset
- As a function of the ratio of the within cluster scatter, to the between cluster separation, a **lower value will mean that the clustering is better**
- This affirms the idea that no cluster has to be similar to another, and hence the best clustering scheme essentially minimizes the Davies–Bouldin index
- This index thus defined is an average over all the i clusters, and hence a good measure of deciding how many clusters actually exists in the data is to plot it against the number of clusters it is calculated over
- The number i for which this value is **the lowest is a good measure** of the number of clusters the data could be ideally classified into

Evaluasi Model Data Mining

1. Estimation:

- **Error:** Root Mean Square Error (RMSE), MSE, MAPE, etc

2. Prediction/**Forecasting** (Prediksi/Peramalan):

- **Error:** Root Mean Square Error (RMSE) , MSE, MAPE, etc

3. Classification:

- **Confusion Matrix:** Accuracy
- **ROC Curve:** Area Under Curve (AUC)

4. Clustering:

- **Internal Evaluation:** Davies–Bouldin index, Dunn index,
- **External Evaluation:** Rand measure, F-measure, Jaccard index, Fowlkes–Mallows index, Confusion matrix

5. Association:

- **Lift Charts:** Lift Ratio
- **Precision and Recall** (F-measure)

Tugas: Mengolah Semua Dataset

1. Lakukan **ujicoba terhadap semua dataset** yang ada di folder **datasets**, dengan menggunakan berbagai metode data mining yang sesuai (estimasi, prediksi, klasifikasi, clustering, association)
2. Kombinasikan **pengujian** dengan pemecahan data training-testing, dan pengujian dengan menggunakan metode **X validation**
3. **Ukur performance dari model** yang terbentuk dengan menggunakan metode pengukuran sesuai dengan metode data mining yang dipilih
4. Jelaskan secara mendetail **tahapan ujicoba** yang dilakukan, kemudian lakukan **analisis dan sintesis**, dan buat laporan dalam bentuk **slide**
5. Presentasikan di depan kelas

Tugas: Mereview Paper

 4. Metode Penelitian
 5. Hasil Penelitian

Tugas: Menulis Paper Penelitian

- Cari **dataset** yang ada di sekitar kita
- Lakukan penelitian berupa **komparasi dari (minimal) 5 algoritma** machine learning untuk memining knowledge dari dataset tersebut
- **Gunakan uji beda** (baik parametrik dan non parametric) untuk analisis dan pembuatan ranking dari algoritma machine learning
- Tulis makalah tentang penelitian yang kita buat
- **Contoh-contoh makalah** komparasi ada di:
<http://romisatriawahono.net/lecture/dm/paper/method%20comparison/>
- **Upload seluruh file laporan** ke Card di Trello.Com
- **Deadline:** sehari sebelum mata kuliah berikutnya

Paper Formatting

- Ikuti template dan contoh paper dari:
<http://journal.ilmukomputer.org>
- Isi paper:
 - **Abstract**: Harus berisi obyek-masalah-metode-hasil
 - **Introduction**: Latar belakang masalah penelitian dan struktur paper
 - **Related Work**: Penelitian yang berhubungan
 - **Theoretical Foundation**: Landasan dari berbagai teori yang digunakan
 - **Proposed Method**: Metode yang diusulkan
 - **Experimental Results**: Hasil eksperimen
 - **Conclusion**: Kesimpulan dan future works

Competency Check

1. Dataset – Methods – Knowledge

1. Dataset Main Golf (Klasifikasi)
2. Dataset Iris (Klasifikasi)
3. Dataset Iris (Klastering)

7. Dataset Transaksi (Association)
8. Dataset Harga Saham (Forecasting)

2. Dataset – Methods – Knowledge – Evaluation

1. Manual
2. Data Split Operator
3. Cross Validation

3. Methods Comparison

- Uji t-Test

4. Paper Reading

1. Lan Yu (DeLong Pearson Test)
2. Wahono (Friedman Test)

2.4 Proses Data Mining berbasis Metodologi CRISP-DM

Data Mining Standard Process

- Dunia industri yang beragam bidangnya memerlukan **proses yang standard** yang mampu mendukung penggunaan data mining untuk menyelesaikan masalah bisnis
- Proses tersebut harus dapat digunakan di **lintas industry** (cross-industry) dan **netral secara bisnis**, tool dan aplikasi yang digunakan, serta mampu menangani strategi pemecahan masalah bisnis dengan menggunakan data mining
- Pada tahun 1996, lahirlah salah satu standard proses di dunia data mining yang kemudian disebut dengan: the **Cross-Industry Standard Process for Data Mining** (CRISP–DM) (*Chapman, 2000*)

CRISP-DM

1. Business Understanding

- Enunciate the **project objectives and requirements** clearly in terms of the business or research unit as a whole
- Translate these goals and restrictions into the formulation of a **data mining problem definition**
- Prepare a **preliminary strategy for achieving these objectives**
- Designing **what you are going to build**

2. Data Understanding

- Collect the data
- Use **exploratory data analysis** to familiarize yourself with the data and discover initial insights
- **Evaluate** the quality of the data
- If desired, **select interesting subsets** that may contain actionable patterns

3. Data Preparation

- Prepare from the initial raw data the final **data set** that is to be used for all subsequent phases
- Select the cases and variables you want to **analyze** and that are appropriate for your analysis
- Perform data **cleaning, integration, reduction** and **transformation**, so it is ready for the modeling tools

4. Modeling

- Select and apply appropriate modeling techniques
- Calibrate model settings to optimize results
- Remember that often, several different techniques may be used for the same data mining problem
- If necessary, loop back to the data preparation phase to bring the form of the data into line with the specific requirements of a particular data mining technique

5. Evaluation

- Evaluate the one or more models delivered in the modeling phase for quality and effectiveness before deploying them for use in the field
- Determine whether the model in fact achieves the objectives set for it in the first phase
- Establish whether some important facet of the business or research problem has not been accounted for sufficiently
- Come to a decision regarding use of the data mining results

6. Deployment

- Make **use of the models created**:
 - model creation does **not signify the completion** of a project
- Example of a **simple deployment**:
 - Generate a **report**
- Example of a **more complex deployment**:
 - Implement a **parallel data mining process** in another department
- For businesses, the **customer often carries out the deployment based on your model**

CRISP-DM: Detail Flow

Studi Kasus CRISP-DM

Heating Oil Consumption – Correlational Methods

(Matthew North, *Data Mining for the Masses 2nd Edition*, 2016,
Chapter 4 Correlational Methods, pp. 69-76)

Dataset: [HeatingOil.csv](#)

CRISP-DM

1. Business Understanding

- **Problems:**

- Sarah is a **regional sales manager** for a nationwide supplier of fossil fuels for home heating
- Marketing **performance is very poor and decreasing**, while **marketing spending is increasing**
- She feels a need to understand the types of behaviors and other factors that may **influence the demand for heating oil** in the domestic market
- She recognizes that **there are many factors that influence heating oil consumption**, and believes that by investigating the **relationship between a number of those factors**, she will be able to better monitor and respond to heating oil demand, and also help her to design marketing strategy in the future

- **Objective:**

- To investigate the **relationship between a number of factors** that influence heating oil consumption

2. Data Understanding

- In order to investigate her question, Sarah has enlisted our help in creating a **correlation matrix of six attributes**
- Using employer's data resources which are primarily drawn from the company's billing database, we create a data set comprised of the following **attributes**:
 1. **Insulation**: This is a **density rating**, ranging from one to ten, indicating the thickness of each home's insulation. A home with a density rating of **one is poorly** insulated, while a home with a density of **ten has excellent** insulation
 2. **Temperature**: This is the **average outdoor ambient temperature** at each home for the most recent year, measure in degree Fahrenheit
 3. **Heating_Oil**: This is the total **number of units of heating oil purchased** by the owner of each home in the most recent year
 4. **Num_Occupants**: This is the **total number of occupants** living in each home
 5. **Avg_Age**: This is the **average age of those occupants**
 6. **Home_Size**: This is a rating, on a scale of **one to eight**, of the **home's overall size**. The higher the number, the larger the home

Data set: HeatingOil.csv

Result History		ExampleSet (Retrieve HeatingOil)

	18	186	4	76	1	50.500	4

3. Data Preparation

- Data set appears to be **very clean** with:
 - No missing values in any of the six attributes
 - No inconsistent data apparent in our ranges (Min-Max) or other descriptive statistics

Name	Type	Missing	Statistics	Filter (6 / 6 attributes):
Heating_Oil	Integer	0	Min 114, Max 301, Average 197.394	Search for Attributes
Insulation	Integer	0	Min 2, Max 10, Average 6.214	
Temperature	Integer	0	Min 38, Max 90, Average 65.079	
Num_Occupants	Integer	0	Min 1, Max 10, Average 3.113	
Avg_Age	Real	0	Min 15.100, Max 72.200, Average 42.706	
Home_Size	Integer	0	Min 1, Max 8, Average 4.649	

4. Modeling

4. Modeling

- Hasil correlation matrix berupa **tabel**
- Semakin tinggi nilainya (semakin tebal warna ungu), **semakin tinggi tingkat korelasinya**

Attributes	Insulation	Temperature	Heating_Oil	Num_Occupants	Avg_Age	Home_Size
Insulation	1	-0.794	0.736	-0.013	0.643	0.201
Temperature	-0.794	1	-0.774	0.013	-0.673	-0.214
Heating_Oil	0.736	-0.774	1	-0.042	0.848	0.381
Num_Occupants	-0.013	0.013	-0.042	1	-0.048	-0.023
Avg_Age	0.643	-0.673	0.848	-0.048	1	0.307
Home_Size	0.201	-0.214	0.381	-0.023	0.307	1

5. Evaluation

Positive Correlation

				
Heating Oil use rises	Insulation rating also rises		Heating Oil use falls	Insulation rating also falls

Whenever both attribute values move in the same direction, the correlation is positive.

Negative Correlation

				
Temperature rises	Insulation rating falls		Temperature falls	Insulation rating rises

Whenever attribute values move in opposite directions, the correlation is negative.

-1 ← -0.8	-0.8 ← -0.6	-0.6 ← -0.4	-0.4 ← 0	0 → 0.4	0.4 → 0.6	0.6 → 0.8	0.8 → 1.0
Very Strong Correlation	Strong Correlation	Some Correlation	No correlation	No correlation	Some correlation	Strong correlation	Very strong correlation

Attributes	Heating_Oil	Insulation	Temperature	Num_Occupants	Avg_Age	Home_Size
Heating_Oil	1	0.736	-0.774	-0.042	0.848	0.381
Insulation	0.736	1	-0.794	-0.013	0.643	0.201
Temperature	-0.774	-0.794	1	0.013	-0.673	-0.214
Num_Occupants	-0.042	-0.013	0.013	1	-0.048	-0.023
Avg_Age	0.848	0.643	-0.673	-0.048	1	0.307
Home_Size	0.381	0.201	-0.214	-0.023	0.307	1

5. Evaluation

- Atribut (faktor) yang paling **signifikan berpengaruh** (hubungan positif) pada konsumsi minyak pemanas (Heating Oil) adalah **Average Age (Rata-Rata Umur)** penghuni rumah
- Atribut (faktor) kedua yang paling berpengaruh adalah **Temperature** (hubungan **negatif**)
- Atribut (faktor) ketiga yang paling berpengaruh adalah **Insulation** (hubungan **positif**)
- Atribut **Home Size**, pengaruhnya sangat kecil, sedangkan **Num_Occupant** boleh dikatakan tidak ada pengaruh ke konsumsi minyak pemanas

Attributes	Heating_Oil	Insulation	Temperature	Num_Occupants	Avg_Age	Home_Size
Heating_Oil	1	0.736	-0.774	-0.042	0.848	0.381
Insulation	0.736	1	-0.794	-0.013	0.643	0.201
Temperature	-0.774	-0.794	1	0.013	-0.673	-0.214
Num_Occupants	-0.042	-0.013	0.013	1	-0.048	-0.023
Avg_Age	0.848	0.643	-0.673	-0.048	1	0.307
Home_Size	0.381	0.201	-0.214	-0.023	0.307	1

5. Evaluation

- Grafik menunjukkan bahwa konsumsi minyak memiliki **korelasi positif** dengan rata-rata usia
- Meskipun ada beberapa **anomali** juga terjadi:
 1. Ada beberapa orang yang rata-rata usia tinggi, tapi kebutuhan minyaknya rendah (warna **biru muda** di kolom kiri bagian atas)
 2. Ada beberapa orang yang rata-rata usia rendah, tapi kebutuhan minyaknya tinggi (warna **merah** di kolom kanan bagian bawah)

5. Evaluation

1. Grafik menunjukkan hubungan antara temperature dan insulation, dengan warna adalah konsumsi minyak (semakin merah kebutuhan minyak semakin tinggi)
2. Secara umum dapat dikatakan bahwa hubungan temperatur dengan insulation dan konsumsi minyak adalah negatif. Jadi temperatur semakin rendah, kebutuhan minyak semakin tinggi (kolom kiri bagian atas) ditunjukkan dengan banyak yang berwarna kuning dan merah
3. Insulation juga berhubungan negatif dengan temperatur, sehingga makin rendah temperatur, semakin butuh insulation
4. Beberapa anomali terdapat pada Insulation yang rendah nilainya, ada beberapa yang masih memerlukan minyak yang tinggi

5. Evaluation

1. Grafik tiga dimensi menunjukkan hubungan antara temperatur, rata-rata usia dan insulation
2. Warna menunjukkan kebutuhan minyak, semakin memerah maka semakin tinggi
3. Temperatur semakin tinggi semakin tidak butuh minyak (warna biru tua)
4. Rata-rata usia dan insulation semakin tinggi semakin butuh minyak

6. Deployment

Dropping the Num_Occupants attribute

- While the number of people living in a home might logically seem like a variable that would influence energy usage, in our model **it did not correlate in any significant way** with anything else
- Sometimes there are **attributes that don't turn out to be very interesting**

Attributes	Heating_Oil	Insulation	Temperature	Num_Occupants	Avg_Age	Home_Size
Heating_Oil	1	0.736	-0.774	-0.042	0.848	0.381
Insulation	0.736	1	-0.794	-0.013	0.643	0.201
Temperature	-0.774	-0.794	1	0.013	-0.673	-0.214
Num_Occupants	-0.042	-0.013	0.013	1	-0.048	-0.023
Avg_Age	0.848	0.643	-0.673	-0.048	1	0.307
Home_Size	0.381	0.201	-0.214	-0.023	0.307	1

6. Deployment

Adding additional attributes to the data set

- It turned out that the **number of occupants in the home didn't correlate** much with other attributes, but that doesn't mean that other attributes would be equally uninteresting
- For example, what if Sarah had access to the **number of furnaces and/or boilers** in each home?
- Home_size was slightly correlated with Heating_Oil usage, so perhaps the **number of instruments** that consume heating oil in each home would tell an interesting story, or at least add to her insight

6. Deployment

Investigating the role of home insulation

- The Insulation rating attribute was fairly strongly correlated with a number of other attributes
- There may be some **opportunity there to partner with a company that specializes in adding insulation to existing homes**

Attributes	Heating_Oil	Insulation	Temperature	Num_Occupants	Avg_Age	Home_Size
Heating_Oil	1	0.736	-0.774	-0.042	0.848	0.381
Insulation	0.736	1	-0.794	-0.013	0.643	0.201
Temperature	-0.774	-0.794	1	0.013	-0.673	-0.214
Num_Occupants	-0.042	-0.013	0.013	1	-0.048	-0.023
Avg_Age	0.848	0.643	-0.673	-0.048	1	0.307
Home_Size	0.381	0.201	-0.214	-0.023	0.307	1

6. Deployment

Focusing the marketing efforts to the city with low temperature and high average age of citizen

- The **temperature attribute** was fairly strongly negative correlated with a heating oil consumption
- The **average age attribute** was strongest positive correlated with a heating oil consumption

Attributes	Heating_Oil	Insulation	Temperature	Num_Occupants	Avg_Age	Home_Size
Heating_Oil	1	0.736	-0.774	-0.042	0.848	0.381
Insulation	0.736	1	-0.794	-0.013	0.643	0.201
Temperature	-0.774	-0.794	1	0.013	-0.673	-0.214
Num_Occupants	-0.042	-0.013	0.013	1	-0.048	-0.023
Avg_Age	0.848	0.643	-0.673	-0.048	1	0.307
Home_Size	0.381	0.201	-0.214	-0.023	0.307	1

6. Deployment

Adding greater granularity in the data set

- This data set has yielded some interesting results, but **it's pretty general**
- We have used average yearly temperatures and total annual number of heating oil units in this model
- But we also know that temperatures fluctuate throughout the year in most areas of the world, and thus **monthly, or even weekly measures** would not only be likely to show more detailed results of demand and usage over time, but the correlations between attributes would probably be more interesting
- From our model, Sarah now knows how certain attributes interact with one another, but in the day-to-day business of doing her job, **she'll probably want to know about usage over time periods shorter than one year**

Studi Kasus CRISP-DM

Heating Oil Consumption – Linear Regression

(Matthew North, *Data Mining for the Masses 2nd Edition*, 2016,
Chapter 8 Linear Regression, pp. 159-171)

Dataset: [HeatingOil.csv](#)

Dataset: [HeatingOil-scoring.csv](#)

<http://romisatriawahono.net/lecture/dm/dataset/>

CRISP-DM

CRISP-DM: Detail Flow

1. Business Understanding

- **Problems:**

- **Business is booming**, her sales team is signing up thousands of new clients, and she wants to be sure the company will be able to meet this new level of demand
- Sarah's new data mining objective is pretty clear: she wants **to anticipate demand for a consumable product**
- We will use a linear regression model to help her with her desired predictions. **She has data, 1,218 observations** that give an attribute profile for each home, along with those homes' annual heating oil consumption
- She wants to use this data set as training data to predict the usage that **42,650 new clients** will bring to her company
- She knows that these new clients' homes are similar in nature to her existing client base, so the existing customers' usage behavior should serve as a solid gauge for predicting future usage by new customers

- **Objective:**

- to predict the usage that **42,650 new clients** will bring to her company

2. Data Understanding

- Sarah has assembled separate Comma Separated Values file containing all of these same attributes, for her **42,650 new clients**
- She has provided this data set to us to use as the scoring data set in our model
- Data set comprised of the following **attributes**:
 - **Insulation**: This is a density rating, ranging from one to ten, indicating the thickness of each home's insulation. A home with a density rating of one is poorly insulated, while a home with a density of ten has excellent insulation
 - **Temperature**: This is the average outdoor ambient temperature at each home for the most recent year, measure in degree Fahrenheit
 - **Heating_Oil**: This is the total number of units of heating oil purchased by the owner of each home in the most recent year
 - **Num_Occupants**: This is the total number of occupants living in each home
 - **Avg_Age**: This is the average age of those occupants
 - **Home_Size**: This is a rating, on a scale of one to eight, of the home's overall size. The higher the number, the larger the home

3. Data Preparation

- **Filter Examples:** attribute value filter or custom filter
 - Avg_Age $\geq$ 15.1
 - Avg_Age $\leq$ 72.2
- **Deleted Records** = $42650 - 42042 = 508$

Latihan

- Karena bantuan data mining sebelumnya, Sarah akhirnya mendapatkan **promosi menjadi VP marketing**, yang mengelola ratusan marketer
- Sarah ingin para marketer dapat memprediksi pelanggan potensial mereka masing-masing secara mandiri. Masalahnya, data **HeatingOil.csv hanya boleh diakses oleh level VP (Sarah)**, dan tidak diperbolehkan diakses oleh marketer secara langsung
- Sarah ingin masing-masing marketer membuat proses yang dapat mengestimasi kebutuhan konsumsi minyak dari *client* yang mereka *approach*, dengan menggunakan model yang sebelumnya dihasilkan oleh Sarah, meskipun **tanpa mengakses data training (HeatingOil.csv)**
- Asumsikan bahwa data **HeatingOil-Marketing.csv** adalah data calon pelanggan yang berhasil di *approach* oleh salah satu marketingnya
- Yang harus dilakukan **Sarah** adalah membuat proses untuk:
 1. Mengkomparasi algoritma yang menghasilkan model yang memiliki akurasi tertinggi (LR, NN, SVM), gunakan 10 Fold X Validation
 2. Menyimpan model terbaik ke dalam suatu file (operator **Store**)
- Yang harus dilakukan **Marketer** adalah membuat proses untuk:
 1. Membaca model yang dihasilkan Sarah (operator **Retrieve**)
 2. Menerapkannya di data **HeatingOil-Marketing.csv** yang mereka miliki
- Mari kita bantu Sarah dan Marketer membuat dua proses tersebut

Proses Komparasi Algoritma (Sarah)

Proses Pengujian Data (Marketer)

Studi Kasus CRISP-DM

Kelulusan Mahasiswa di Universitas Suka Belajar

Dataset: [datakelulusanmahasiswa.xls](#)

CRISP-DM

1. Business Understanding

- **Problems:**

- Budi adalah Rektor di Universitas Suka Belajar
- Universitas Suka Belajar memiliki masalah besar karena **rasio kelulusan mahasiswa tiap angkatan sangat rendah**
- Budi ingin memahami dan membuat pola dari profile mahasiswa yang bisa lulus tepat waktu dan yang tidak lulus tepat waktu
- Dengan pola tersebut, Budi bisa melakukan konseling, terapi, dan memberi peringatan dini kepada mahasiswa kemungkinan tidak lulus tepat waktu untuk memperbaiki diri, sehingga akhirnya bisa lulus tepat waktu

- **Objective:**

- Menemukan pola dari mahasiswa yang lulus tepat waktu dan tidak

2. Data Understanding

- Untuk menyelesaikan masalah, Budi mengambil data dari sistem informasi akademik di universitasnya
- Data-data dikumpulkan dari data profil mahasiswa dan indeks prestasi semester mahasiswa, dengan atribut seperti di bawah
 1. NAMA
 2. JENIS KELAMIN: Laki-Laki atau Perempuan
 3. STATUS MAHASISWA: Mahasiswa atau Bekerja
 4. UMUR:
 5. STATUS NIKAH: Menikah atau Belum Menikah
 6. IPS 1: Indeks Prestasi Semester 1
 7. IPS 2: Indeks Prestasi Semester 1
 8. IPS 3: Indeks Prestasi Semester 1
 9. IPS 4: Indeks Prestasi Semester 1
 10. IPS 5: Indeks Prestasi Semester 1
 11. IPS 6: Indeks Prestasi Semester 1
 12. IPS 7: Indeks Prestasi Semester 1
 13. IPS 8: Indeks Prestasi Semester 1
 14. IPK: Indeks Prestasi Kumulatif
 15. STATUS KELULUSAN: Terlambat atau Tepat

3. Data Preparation

Data set: **datakelulusanmahasiswa.xls**

Row No.	STATUS KEL...	NAMA	JENIS KELA...	STATUS MA...	UMUR	STATUS NIK...	IPS 1	IPS 2
1	TERLAMBAT	ANIK WIDAYA...	PEREMPUAN	BEKERJA	28	BELUM MENI...	2.760	2.800

```

5. Evaluation

- Atribut atau faktor yang **paling berpengaruh** adalah Status Mahasiswa, IPS2, IPS5, IPS1
- Atribut atau faktor yang **tidak berpengaruh** adalah Nama, Jenis Kelamin, Umur, IPS6, IPS7, IPS8

6. Deployment

- Budi membuat **program peningkatan disiplin dan pendampingan ke mahasiswa di semester awal (1-2) dan semester 5**, karena faktor yang paling menentukan kelulusan mahasiswa ada di dua semester itu
- Budi membuat **peraturan melarang mahasiswa bekerja paruh waktu di semester awal** perkuliahan, karena beresiko tinggi di kelulusan tepat waktu
- Budi membuat **program kerja paruh waktu di dalam kampus**, sehingga banyak pekerjaan kampus yang bisa intens ditangani, sambil mendidik mahasiswa supaya memiliki pengalaman kerja. Dan yang paling penting mahasiswa tidak meninggalkan kuliah karena pekerjaan
- Budi **memasukkan pola dan model yang terbentuk ke dalam sistem informasi akademik**, dimana sistem dibuat cerdas, sehingga bisa mengirimkan email analisis pola secara otomatis ke mahasiswa sesuai profilnya

Latihan

- Pahami dan lakukan eksperimen berdasarkan seluruh studi kasus yang ada di buku **Data Mining for the Masses** (*Matthew North*)
- Pahami bahwa metode CRISP-DM membantu kita memahami penggunaan metode data mining yang lebih sesuai dengan kebutuhan organisasi

Tugas Menyelesaikan Masalah Organisasi

- Analisis **masalah dan kebutuhan yang ada di organisasi lingkungan sekitar** anda
- Kumpulkan dan **review dataset yang tersedia**, dan hubungkan masalah dan kebutuhan tadi dengan data yang tersedia (**analisis dari 5 peran data mining**)
 - Bila memungkinkan pilih **beberapa peran sekaligus untuk mengolah data** tersebut, misalnya: lakukan association (analisis faktor), sekaligus estimation atau clustering
- Lakukan proses **CRISP-DM** untuk menyelesaikan masalah yang ada di organisasi sesuai dengan data yang didapatkan
 - Pada proses **data preparation**, lakukan data cleaning (replace missing value, replace, filter attribute) sehingga data siap dimodelkan
 - Lakukan juga **komparasi algoritma** untuk memilih algoritma terbaik
- Rangkumkan dalam **bentuk slide** dengan contoh studi kasus Sarah yang menggunakan data mining untuk:
 - Menganalisis faktor yang berhubungan (**matrix correlation**)
 - Mengestimasi jumlah stok minyak (**linear regression**)

Studi Kasus CRISP-DM

Profiling Tersangka Koruptor

Process

Forecasting Jumlah Wajib Laporan

Rekomendasi Hasil Pemeriksaan LHKPN

Pola Rekomendasi Hasil Pemeriksaan LHKPN

3. Persiapan Data

3.1 Data Cleaning

3.2 Data Reduction

3.3 Data Transformation and Data Discretization

3.4 Data Integration

CRISP-DM

Why Preprocess the Data?

Measures for **data quality**: A multidimensional view

- **Accuracy**: correct or wrong, accurate or not
- **Completeness**: not recorded, unavailable, ...
- **Consistency**: some modified but some not, ...
- **Timeliness**: timely update?
- **Believability**: how trustable the data are correct?
- **Interpretability**: how easily the data can be understood?

Major Tasks in Data Preprocessing

1. Data **cleaning**

- Fill in **missing** values
- Smooth **noisy** data
- Identify or **remove outliers**
- Resolve **inconsistencies**

2. Data **reduction**

- **Dimensionality** reduction
- **Numerosity** reduction
- Data **compression**

3. Data **transformation** and data **discretization**

- **Normalization**
- Concept hierarchy generation

4. Data **integration**

- Integration of **multiple databases** or files

Data Preparation Law (Data Mining Law 3)

Data preparation is more than half of every data mining process

- Maxim of data mining: most of the effort in a data mining project is spent in data acquisition and preparation, and informal estimates vary from 50 to 80 percent
- The purpose of data preparation is:
 1. To put the data into a form in which the data mining question can be asked
 2. To make it easier for the analytical techniques (such as data mining algorithms) to answer it

3.1 Data Cleaning

Data Cleaning

Data in the Real World Is Dirty: Lots of potentially incorrect data, e.g., instrument faulty, human or computer error, transmission error

- **Incomplete:** lacking attribute values, lacking certain attributes of interest, or containing only aggregate data
 - e.g., Occupation=" " (**missing data**)
- **Noisy:** containing noise, errors, or outliers
 - e.g., Salary="-10" (**an error**)
- **Inconsistent:** containing discrepancies in codes or names
 - e.g., Age="42", Birthday="03/07/2010"
 - Was rating "1, 2, 3", now rating "A, B, C"
- Discrepancy between **duplicate records**
 - Intentional (e.g., **disguised missing data**)
 - Jan. 1 as everyone's birthday?

Incomplete (Missing) Data

- Data is **not always available**
 - E.g., **many tuples have no recorded value** for several attributes, such as customer income in sales data
- **Missing data** may be due to
 - equipment **malfunction**
 - inconsistent with other recorded data and thus **deleted**
 - data not entered due to **misunderstanding**
 - certain data **may not be considered important** at the time of entry
 - not register history or **changes of the data**
- Missing data may **need to be inferred**

Contoh Missing Data

- Dataset: **MissingDataSet.csv**

MissingDataSet.csv

- Jerry is the marketing manager for a **small Internet design and advertising firm**
- Jerry's boss asks him to develop a data set containing **information about Internet users**
- The company will use this data to determine **what kinds of people are using the Internet** and **how the firm may be able to market their services to this group of users**
- To accomplish his assignment, Jerry creates an online survey and places links to the survey on several popular Web sites
- Within two weeks, Jerry has collected enough data to begin analysis, but he finds that his data needs to be **denormalized**
- He also notes that some observations in the set are **missing values** or they appear to contain **invalid values**
- Jerry realizes that some additional work on the data needs to take place before analysis begins.

How to Handle Missing Data?

- **Ignore the tuple:**
 - Usually done when class **label is missing** (when doing classification)—not effective when the % of missing values per attribute varies considerably
- **Fill in the missing value manually:**
 - **Tedious + infeasible?**
- **Fill in it automatically** with
 - A **global constant**: e.g., “unknown”, a new class?!
 - The **attribute mean**
 - The **attribute mean for all samples belonging to the same class**: smarter
 - The **most probable value**: inference-based such as Bayesian formula or decision tree

Latihan

Missing Value Filtering

The screenshot displays a data processing workflow in a software application. The main window, titled "Process", shows a flow from "Retrieve MissingData..." to "Filter Examples". The "Filter Examples" window is highlighted with an orange border and contains a funnel icon and a green checkmark. A "Parameters" panel on the right shows "Filter Examples" with a "filters" section containing an "Add Filter..." button and a "condition class" dropdown set to "custom_fil...". Below this is an "invert filter" checkbox. A "Data Editor" panel at the bottom shows a table with columns "Insulation (integer) regular" and "Temperature (integer) regular". A "Create Filters: filters" dialog box is open in the foreground, showing a funnel icon and the text "Create Filters: filters Defines the list of filters to apply." The dialog has a dashed orange border around the filter selection area, which includes a dropdown menu set to "Online_Shopping", another dropdown set to "is not missing", and a text input field. The dialog also has "Add Entry", "OK", and "Cancel" buttons at the bottom.

Noisy Data

- Noise: **random error** or variance in a measured variable
- **Incorrect attribute** values may be due to
 - Faulty data collection instruments
 - Data entry problems
 - Data transmission problems
 - Technology limitation
 - Inconsistency in naming convention
- **Other data problems** which require data cleaning
 - Duplicate records
 - Incomplete data
 - Inconsistent data

How to Handle Noisy Data?

- **Binning**

- First **sort data and partition** into (equal-frequency) bins
- Then one can **smooth by bin means**, smooth by bin median, smooth by bin boundaries, etc.

- **Regression**

- Smooth by **fitting the data into regression** functions

- **Clustering**

- Detect and **remove outliers**

- **Combined computer and human inspection**

- Detect suspicious values and **check by human** (e.g., deal with possible outliers)

Data Cleaning as a Process

- Data **discrepancy detection**
 - Use **metadata** (e.g., domain, range, dependency, distribution)
 - Check **field overloading**
 - Check **uniqueness rule**, consecutive rule and null rule
 - Use **commercial tools**
 - **Data scrubbing**: use simple domain knowledge (e.g., postal code, spell-check) to detect errors and make corrections
 - **Data auditing**: by analyzing data to discover rules and relationship to detect violators (e.g., correlation and clustering to find outliers)
- Data **migration** and integration
 - Data **migration tools**: allow transformations to be specified
 - **ETL (Extraction/Transformation/Loading) tools**: allow users to specify transformations through a graphical user interface
- Integration of the two processes
 - **Iterative and interactive** (e.g., Potter's Wheels)

Latihan

Synopsis

This operator replaces parts of the values of selected nominal attributes matching a specified regular expression by a specified replacement.

Latihan

- Impor data **MissingDataValue-Noisy.csv**
- Gunakan Regular Expression (operator **Replace**) untuk mengganti semua **noisy data** pada atribut **nominal** menjadi “N”

ExampleSet (Retrieve MissingDataSet-Noisy) x

Turbo Prep Auto Model

Filter (11 / 11 examples): all

Studi Kasus CRISP-DM

Sport Skill – Discriminant Analysis

(Matthew North, *Data Mining for the Masses 2nd Edition*, 2016,
Chapter 7 Discriminant Analysis, pp. 123-143)

Dataset: [SportSkill-Training.csv](#)

Dataset: [SportSkill-Scoring.csv](#)

1. Business Understanding

- **Motivation:**

- Gill runs a **sports academy** designed to help high school aged athletes achieve their maximum athletic potential. He focuses on four major sports: **Football, Basketball, Baseball** and **Hockey**
- He has found that while many high school athletes enjoy participating in a number of sports in high school, as they begin to consider playing a sport at the college level, they would prefer to **specialize in one sport**
- As he's worked with athletes over the years, **Gill has developed an extensive data set**, and he now is wondering if he can use past performance from some of his previous clients to predict prime sports for up-and-coming high school athletes
- By evaluating each athlete's performance across a battery of test, Gill hopes we can help him figure out for **which sport each athlete has the highest aptitude**

- **Objective:**

- Ultimately, **he hopes he can make a recommendation to each athlete as to the sport in which they should most likely choose to specialize**

2. Data Understanding

- Every athlete that has enrolled at Gill's academy over the past several years has taken a battery test, which tested for a number of athletic and personal traits
- Because the academy has been operating for some time, Gill has the benefit of knowing which of his former pupils have gone on to specialize in a single sport, and which sport it was for each of them

2. Data Understanding

- Working with Gill, we gather the results of the batteries for all former clients who have gone on to specialize
- Gill adds the sport each person specialized in, and we have a data set comprised of 493 observations containing the following attributes:
 1. Age:
 2. Strength:
 3. Quickness:
 4. Injury:
 5. Vision:
 6. Endurance:
 7. Agility:
 8. Decision Making:
 9. Prime Sport:

3. Data Preparation

- **Filter Examples:** attribute value filter
 - Decision_Making>=3
 - Decision_Making<=100
- Deleted Records= 493-482=**11**

3.2 Data Reduction

Data Reduction Methods

- Data Reduction

- Obtain a **reduced representation of the data set** that is much smaller in volume but yet produces the same analytical results

- Why Data Reduction?

- A database/data warehouse may store **terabytes of data**
- Complex data analysis **take a very long time to run** on the complete dataset

- Data Reduction Methods

1. Dimensionality Reduction

1. Feature Extraction

2. Feature Selection

1. Filter Approach
 2. Wrapper Approach
 3. Embedded Approach

2. Numerosity Reduction (Data Reduction)

- Regression and Log-Linear Models
- Histograms, clustering, sampling

1. Dimensionality Reduction

- Curse of **dimensionality**
 - When dimensionality increases, **data becomes increasingly sparse**
 - Density and distance between points, which is critical to clustering, outlier analysis, **becomes less meaningful**
 - The possible combinations of subspaces will grow exponentially
- Dimensionality **reduction**
 - Avoid the curse of dimensionality
 - Help **eliminate irrelevant features** and reduce noise
 - **Reduce time and space** required in data mining
 - Allow easier visualization
- Dimensionality **Reduction Methods**:
 1. **Feature Extraction**: Wavelet transforms, Principal Component Analysis (PCA)
 2. **Feature Selection**: Filter, Wrapper, Embedded

Principal Component Analysis (Steps)

- Given N data vectors from n -dimensions, find $k \leq n$ **orthogonal vectors (*principal components*)** that can be best used to represent data
 1. **Normalize input data**: Each attribute falls within the same range
 2. **Compute k orthonormal (unit) vectors**, i.e., *principal components*
 3. Each input data (vector) is a linear combination of the k principal component vectors
 4. The principal components are **sorted in order of decreasing “significance”** or strength
 5. Since the components are sorted, the size of the data can be reduced by **eliminating the *weak components***, i.e., those with low variance
- Works for **numeric data only**

Latihan

- Lakukan eksperimen mengikuti buku Markus Hofmann (Rapid Miner - Data Mining Use Case) **Chapter 4 (k-Nearest Neighbor Classification II)** pp. 45-51
- Dataset: [glass.data](#)
- Analisis **metode preprocessing** apa saja yang digunakan dan mengapa perlu dilakukan pada dataset tersebut!
- Bandingkan **akurasi** dari k-NN dan PCA+k-NN

Feature/Attribute Selection

- Another way to reduce dimensionality of data
- **Redundant** attributes
 - Duplicate much or all of the information contained in one or more other attributes
 - E.g., purchase price of a product and the amount of sales tax paid
- **Irrelevant** attributes
 - Contain no information that is useful for the data mining task at hand
 - E.g., students' ID is often irrelevant to the task of predicting students' GPA

Feature Selection Approach

A number of proposed approaches for feature selection can broadly be categorized into the following three classifications: **wrapper**, **filter**, and **embedded** (Liu & Tu, 2004)

1. In the **filter approach**, statistical analysis of the feature set is required, **without utilizing any learning model** (Dash & Liu, 1997)
2. In the **wrapper approach**, a predetermined learning model is assumed, wherein **features are selected that justify the learning performance** of the particular learning model (Guyon & Elisseeff, 2003)
3. The **embedded approach** attempts to utilize the complementary strengths of the wrapper and filter approaches (Huang, Cai, & Xu, 2007)

Wrapper Approach vs Filter Approach

Wrapper Approach

Filter Approach

Feature Selection Approach

1. Filter Approach:

- information gain
- chi square
- log likelihood ratio
- etc

2. Wrapper Approach:

- forward selection
- backward elimination
- randomized hill climbing
- etc

3. Embedded Approach:

- decision tree
- weighted naïve bayes
- etc

Latihan

- Lakukan eksperimen mengikuti buku Markus Hofmann (Rapid Miner - Data Mining Use Case) **Chapter 4 (k-Nearest Neighbor Classification II)**
- Ganti PCA dengan **metode feature selection (filter)**, misalnya:
 - Information Gain
 - Chi Squared
 - etc
- Cek di RapidMiner, operator apa saja yang bisa digunakan untuk **mengurangi atau membobot attribute** dari dataset!

No Free Lunch Theory (Data Mining Law 4)

There is No Free Lunch for the Data Miner (NFL-DM)

The right model for a given application can only be discovered by experiment

- Axiom of machine learning: if we knew enough about a problem space, we could choose or **design an algorithm to find optimal solutions** in that problem space with maximal efficiency
- Arguments for the superiority of one algorithm over others in data mining rest on the idea that data mining problem spaces have one particular set of properties, or that **these properties can be discovered by analysis and built into the algorithm**
- However, these views arise from the erroneous idea that, in data mining, **the data miner formulates the problem and the algorithm finds the solution**
- In fact, the **data miner both formulates the problem and finds the solution** – the **algorithm is merely a tool** which the data miner uses to assist with certain steps in this process

2. Numerosity Reduction

Reduce data volume by choosing alternative, **smaller forms of data representation**

1. **Parametric methods** (e.g., regression)

- Assume the **data fits some model**, estimate model parameters, store only the parameters, and discard the data (except possible outliers)
- Ex.: **Log-linear models**—obtain value at a point in m -D space as the product on appropriate marginal subspaces

2. **Non-parametric methods**

- **Do not assume models**
- Major families: **histograms, clustering**, sampling, ...

Numerosity Reduction

The screenshot displays the Orange3 data mining software interface. The main workspace shows a workflow with two nodes: 'Retrieve Missing Data' and 'Filter Examples'. The 'Filter Examples' node is highlighted with an orange border. A dialog box titled 'Create Filters: filters' is open in the center, showing a filter rule: 'Online_Shopping is not missing'. The 'Parameters' panel on the right shows the 'Filter Examples' settings, including 'filters', 'condition class', and 'invert filter'. The 'Data Editor' at the bottom shows a table with columns for 'Insulation (integer) regular', 'Temperature (integer) regular', and 'Num...'. The 'Repository Location' is set to '://Local Repository/data/HeatingOil'.

Parametric Data Reduction: Regression and Log-Linear Models

- **Linear regression**
 - Data modeled to fit a straight line
 - Often uses the least-square method to fit the line
- **Multiple regression**
 - Allows a response variable Y to be modeled as a linear function of multidimensional feature vector
- **Log-linear model**
 - Approximates discrete multidimensional probability distributions

Regression Analysis

- **Regression analysis**: A collective name for techniques for the modeling and analysis of numerical data consisting of values of a **dependent variable** (also called **response variable** or *measurement*) and of one or more *independent variables* (aka. **explanatory variables** or **predictors**)
- The parameters are estimated so as to give a "**best fit**" of the data
- Most commonly the best fit is evaluated by using the **least squares method**, but other criteria have also been used
- Used for prediction (including forecasting of time-series data), inference, hypothesis testing, and modeling of causal relationships

Regress Analysis and Log-Linear Models

- **Linear regression:** $Y = w X + b$
 - Two regression coefficients, w and b , specify the line and are to be estimated by using the data at hand
 - Using the least squares criterion to the known values of $Y_1, Y_2, \dots, X_1, X_2, \dots$
- **Multiple regression:** $Y = b_0 + b_1 X_1 + b_2 X_2$
 - Many nonlinear functions can be transformed into the above
- **Log-linear models:**
 - Approximate discrete multidimensional probability distributions
 - Estimate the probability of each point (tuple) in a multi-dimensional space for a set of discretized attributes, based on a smaller subset of dimensional combinations
 - Useful for dimensionality reduction and data smoothing

Histogram Analysis

- Divide data into buckets and store average (sum) for each bucket
- Partitioning **rules**:
 - **Equal-width**: equal bucket range
 - **Equal-frequency** (or equal-depth)

Clustering

- Partition data set into **clusters based on similarity**, and store cluster representation (e.g., centroid and diameter) only
- Can be very effective if data is clustered but not if data is “smeared”
- Can have hierarchical clustering and be stored in multi-dimensional index tree structures
- There are **many choices of clustering definitions** and clustering algorithms

Sampling

- **Sampling**: obtaining a small sample s to represent the whole data set N
- Allow a mining algorithm to run in complexity that is potentially sub-linear to the size of the data
- **Key principle**: Choose a **representative** subset of the data
 - Simple random sampling may have very poor performance in the presence of skew
 - Develop adaptive sampling methods, e.g., stratified sampling
- **Note**: Sampling may not reduce database I/Os (page at a time)

Types of Sampling

- **Simple random sampling**
 - There is an equal probability of selecting any particular item
- **Sampling without replacement**
 - Once an object is selected, it is removed from the population
- **Sampling with replacement**
 - A selected object is not removed from the population
- **Stratified sampling**
 - Partition the data set, and draw samples from each partition (proportionally, i.e., approximately the same percentage of the data)
 - Used in conjunction with skewed data

Sampling: With or without Replacement

Sampling: Cluster or Stratified Sampling

Raw Data

Cluster/Stratified Sample

Stratified Sampling

- **Stratification** is the process of **dividing members of the population into homogeneous subgroups** before sampling
- Suppose that in a company there are the following **staff**:
 - Male, full-time: 90
 - Male, part-time: 18
 - Female, full-time: 9
 - Female, part-time: 63
 - Total: 180
- We are asked to take **a sample of 40 staff, stratified** according to the above categories
- An easy way to calculate the percentage is to multiply each group size by the sample size and divide by the total population:
 - Male, full-time = $90 \times (40 \div 180) = 20$
 - Male, part-time = $18 \times (40 \div 180) = 4$
 - Female, full-time = $9 \times (40 \div 180) = 2$
 - Female, part-time = $63 \times (40 \div 180) = 14$

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses 2nd Edition, 2016, **Chapter 7 Discriminant Analysis**, pp. 125-143
- Datasets:
 - **SportSkill-Training.csv**
 - **SportSkill-Scoring.csv**
- Analisis **metode preprocessing** apa saja yang digunakan dan mengapa perlu dilakukan pada dataset tersebut!

3.3 Data Transformation and Data Discretization

Data Transformation

- A function that **maps the entire set of values of a given attribute** to a new set of replacement values
 - Each old value **can be identified with one of the new values**
- **Methods:**
 - **Smoothing:** Remove noise from data
 - **Attribute/feature construction**
 - New attributes constructed from the given ones
 - **Aggregation:** Summarization, data cube construction
 - **Normalization:** Scaled to fall within a smaller, specified range
 - min-max normalization
 - z-score normalization
 - normalization by decimal scaling
 - **Discretization:** Concept hierarchy climbing

Normalization

- **Min-max normalization**: to $[\text{new\_min}_A, \text{new\_max}_A]$

$$v' = \frac{v - \text{min}_A}{\text{max}_A - \text{min}_A} (\text{new\_max}_A - \text{new\_min}_A) + \text{new\_min}_A$$

- Ex. Let income range \$12,000 to \$98,000 normalized to $[0.0, 1.0]$.

Then \$73,000 is mapped to $\frac{73,600 - 12,000}{98,000 - 12,000} (1.0 - 0) + 0 = 0.716$

- **Z-score normalization** (μ : mean, σ : standard deviation):

$$v' = \frac{v - \mu_A}{\sigma_A}$$

- Ex. Let $\mu = 54,000$, $\sigma = 16,000$. Then $\frac{73,600 - 54,000}{16,000} = 1.225$

- **Normalization by decimal scaling**

$$v' = \frac{v}{10^j} \quad \text{Where } j \text{ is the smallest integer such that } \text{Max}(|v'|) < 1$$

Discretization

- Three **types of attributes**
 - **Nominal** —values from an unordered set, e.g., color, profession
 - **Ordinal** —values from an ordered set, e.g., military or academic rank
 - **Numeric** —real numbers, e.g., integer or real numbers
- **Discretization**: Divide the range of a **continuous attribute into intervals**
 - Interval labels can then be used to replace actual data values
 - **Reduce data size** by discretization
 - Supervised vs. unsupervised
 - Split (top-down) vs. merge (bottom-up)
 - Discretization can be performed recursively on an attribute
 - Prepare for further analysis, e.g., classification

Data Discretization Methods

Typical **methods**: All the methods can be applied recursively

- **Binning**: Top-down split, unsupervised
- **Histogram analysis**: Top-down split, unsupervised
- **Clustering analysis**: Unsupervised, top-down split or bottom-up merge
- **Decision-tree analysis**: Supervised, top-down split
- **Correlation (e.g., χ^2) analysis**: Unsupervised, bottom-up merge

Simple Discretization: Binning

- **Equal-width** (distance) partitioning
 - Divides the range into N intervals of equal size: uniform grid
 - if A and B are the lowest and highest values of the attribute, the width of intervals will be: $W = (B - A)/N$.
 - The most straightforward, but outliers may dominate presentation
 - Skewed data is not handled well
- **Equal-depth** (frequency) partitioning
 - Divides the range into N intervals, each containing approximately same number of samples
 - Good data scaling
 - Managing categorical attributes can be tricky

Binning Methods for Data Smoothing

Sorted data for price (in dollars): 4, 8, 9, 15, 21, 21, 24, 25, 26, 28, 29, 34

- Partition into equal-frequency (**equi-depth**) bins:
 - Bin 1: 4, 8, 9, 15
 - Bin 2: 21, 21, 24, 25
 - Bin 3: 26, 28, 29, 34
- Smoothing by **bin means**:
 - Bin 1: 9, 9, 9, 9
 - Bin 2: 23, 23, 23, 23
 - Bin 3: 29, 29, 29, 29
- Smoothing by **bin boundaries**:
 - Bin 1: 4, 4, 4, 15
 - Bin 2: 21, 21, 25, 25
 - Bin 3: 26, 26, 26, 34

Discretization Without Using Class Labels (Binning vs. Clustering)

Equal frequency (binning)

K-means clustering leads to better results

Discretization by Classification & Correlation Analysis

- **Classification** (e.g., decision tree analysis)
 - Supervised: Given class labels, e.g., cancerous vs. benign
 - Using *entropy* to determine split point (discretization point)
 - Top-down, recursive split
- **Correlation analysis** (e.g., Chi-merge: χ^2 -based discretization)
 - Supervised: use class information
 - Bottom-up merge: find the best neighboring intervals (those having similar distributions of classes, i.e., low χ^2 values) to merge
 - Merge performed recursively, until a predefined stopping condition

Latihan

- Lakukan eksperimen mengikuti buku Markus Hofmann (Rapid Miner - Data Mining Use Case) **Chapter 5 (Naïve Bayes Classification I)**
- Dataset: **crx.data**
- Analisis **metode preprocessing** apa saja yang digunakan dan mengapa perlu dilakukan pada dataset tersebut!
- Bandingkan akurasi model apabila tidak menggunakan filter dan **diskretisasi**
- Bandingkan pula apabila digunakan feature selection (wrapper) dengan **Backward Elimination**

Hasil

	NB	NB+ Filter	NB+ Discretization	NB+ Filter+ Discretization	NB+ Filter+ Discretization + Backward Elimination
Accuracy				85.79	86.26
AUC					

3.4 Data Integration

Data Integration

- **Data integration:**
 - Combines data from **multiple sources** into a **coherent** store
- **Schema Integration:** e.g., $A.cust-id \equiv B.cust-\#$
 - Integrate **metadata** from **different sources**
- **Entity Identification Problem:**
 - Identify real world **entities** from **multiple data sources**, e.g., Bill Clinton = William Clinton
- **Detecting and Resolving Data Value Conflicts**
 - For the same real world entity, attribute values from different sources are different
 - Possible reasons: different representations, different scales, e.g., metric vs. British units

Handling Redundancy in Data Integration

- Redundant data occur often **when integration of multiple databases**
 - **Object identification**: The same attribute or object may have different names in different databases
 - **Derivable data**: One attribute may be a “derived” attribute in another table, e.g., annual revenue
- **Redundant attributes** may be able to be detected by **correlation analysis** and covariance analysis
- Careful integration of the data from multiple sources may help **reduce/avoid redundancies** and inconsistencies and improve mining speed and quality

Correlation Analysis (Nominal Data)

- χ^2 (chi-square) test

$$\chi^2 = \sum \frac{(\text{Observed} - \text{Expected})^2}{\text{Expected}}$$

- The larger the χ^2 value, the **more likely the variables are related**
- The cells that contribute the most to the χ^2 value are those whose **actual count is very different from the expected count**
- Correlation does **not imply causality**
 - # of hospitals and # of car-theft in a city are correlated
 - Both are causally linked to the third variable: population

Chi-Square Calculation: An Example

	Play chess	Not play chess	Sum (row)
Like science fiction	250(90)	200(360)	450
Not like science fiction	50(210)	1000(840)	1050
Sum(col.)	300	1200	1500

- χ^2 (chi-square) calculation (numbers in parenthesis are **expected counts** calculated based on the data distribution in the two categories)

$$\chi^2 = \frac{(250 - 90)^2}{90} + \frac{(50 - 210)^2}{210} + \frac{(200 - 360)^2}{360} + \frac{(1000 - 840)^2}{840} = 507.93$$

- It shows that **like_science_fiction** and **play_chess** are **correlated in the group**

Correlation Analysis (Numeric Data)

- Correlation coefficient (also called **Pearson's product moment coefficient**)

$$r_{A,B} = \frac{\sum_{i=1}^n (a_i - \bar{A})(b_i - \bar{B})}{(n-1)\sigma_A\sigma_B} = \frac{\sum_{i=1}^n (a_i b_i) - n\bar{A}\bar{B}}{(n-1)\sigma_A\sigma_B}$$

where n is the number of tuples, $\bar{A}$ and $\bar{B}$ are the respective means of A and B , σ_A and σ_B are the respective standard deviation of A and B , and $\sum(a_i b_i)$ is the sum of the AB cross-product

- If $r_{A,B} > 0$, A and B are **positively correlated** (A 's values increase as B 's). The higher, the stronger correlation
- $r_{A,B} = 0$: independent; $r_{AB} < 0$: negatively correlated

Visually Evaluating Correlation

Scatter plots
showing the
similarity
from -1 to 1

Correlation

- Correlation measures the **linear relationship between objects**
- To compute correlation, we standardize data objects, A and B, and then **take their dot product**

$$a'_k = (a_k - \text{mean}(A)) / \text{std}(A)$$

$$b'_k = (b_k - \text{mean}(B)) / \text{std}(B)$$

$$\text{correlation}(A, B) = A' \bullet B'$$

Covariance (Numeric Data)

- Covariance is similar to correlation

$$Cov(A, B) = E((A - \bar{A})(B - \bar{B})) = \frac{\sum_{i=1}^n (a_i - \bar{A})(b_i - \bar{B})}{n}$$

Correlation coefficient: $r_{A,B} = \frac{Cov(A, B)}{\sigma_A \sigma_B}$

where n is the number of tuples, $\bar{A}$ and $\bar{B}$ are the respective mean or **expected values** of A and B , σ_A and σ_B are the respective standard deviation of A and B

- Positive covariance:** If $Cov_{A,B} > 0$, then A and B both tend to be larger than their expected values
- Negative covariance:** If $Cov_{A,B} < 0$ then if A is larger than its expected value, B is likely to be smaller than its expected value
- Independence:** $Cov_{A,B} = 0$ but the converse is not true:
 - Some pairs of random variables may have a covariance of 0 but are not independent. Only under some additional assumptions (e.g., the data follow multivariate normal distributions) does a covariance of 0 imply independence

Covariance: An Example

$$Cov(A, B) = E((A - \bar{A})(B - \bar{B})) = \frac{\sum_{i=1}^n (a_i - \bar{A})(b_i - \bar{B})}{n}$$

- It can be simplified in computation as

$$Cov(A, B) = E(A \cdot B) - \bar{A}\bar{B}$$

- Suppose two stocks A and B have the following values in one week: (2, 5), (3, 8), (5, 10), (4, 11), (6, 14).
- Question: If the stocks are affected by the same industry trends, will their prices rise or fall together?
 - $E(A) = (2 + 3 + 5 + 4 + 6) / 5 = 20 / 5 = 4$
 - $E(B) = (5 + 8 + 10 + 11 + 14) / 5 = 48 / 5 = 9.6$
 - $Cov(A, B) = (2 \times 5 + 3 \times 8 + 5 \times 10 + 4 \times 11 + 6 \times 14) / 5 - 4 \times 9.6 = 4$
- Thus, A and B rise together since $Cov(A, B) > 0$

Rangkuman

1. **Data quality**: accuracy, completeness, consistency, timeliness, believability, interpretability
2. **Data cleaning**: e.g. missing/noisy values, outliers
3. **Data reduction**
 - Dimensionality reduction
 - Numerosity reduction
4. **Data transformation** and data discretization
 - Normalization
5. **Data integration** from multiple sources:
 - Entity identification problem
 - Remove redundancies
 - Detect inconsistencies

 5. Kesimpulan
 - Kesimpulan harus sesuai dengan tujuan
 6. Daftar Referensi
 - Masukkan daftar referensi yang digunakan

Tugas Menyelesaikan Masalah Organisasi

- Analisis **masalah dan kebutuhan yang ada di organisasi lingkungan sekitar** anda
- Kumpulkan dan **review dataset yang tersedia**, dan hubungkan masalah dan kebutuhan tadi dengan data yang tersedia (**analisis dari 5 peran data mining**)
 - Bila memungkinkan pilih **beberapa peran sekaligus untuk mengolah data** tersebut, misalnya: lakukan association (analisis faktor), sekaligus estimation atau clustering
- Lakukan proses **CRISP-DM** untuk menyelesaikan masalah yang ada di organisasi sesuai dengan data yang didapatkan
 - Pada proses **data preparation**, lakukan data cleaning (replace missing value, replace, filter attribute) sehingga data siap dimodelkan
 - Lakukan juga **komparasi algoritma** dan **feature selection** untuk memilih pola dan model terbaik
 - Rangkumkan **evaluasi** dari pola/model/knowledge yang dihasilkan dan relasikan hasil evaluasi dengan **deployment** yang dilakukan
- Rangkumkan dalam **bentuk slide** dengan contoh studi kasus Sarah untuk membantu bidang marketing

4. Algoritma Data Mining

4.1 Algoritma Klasifikasi

4.2 Algoritma Klustering

4.3 Algoritma Asosiasi

4.4 Algoritma Estimasi dan Forecasting

4.1 Algoritma Klasifikasi

4.1.1 Decision Tree

Algorithm for Decision Tree Induction

- **Basic algorithm** (a greedy algorithm)
 1. Tree is constructed in a **top-down recursive divide-and-conquer manner**
 2. At start, all the training examples are at the root
 3. **Attributes are categorical** (if continuous-valued, they are **discretized in advance**)
 4. Examples are partitioned recursively based on selected attributes
 5. Test attributes are selected **on the basis of a heuristic or statistical measure** (e.g., **information gain, gain ratio, gini index**)
- **Conditions for stopping partitioning**
 - All samples for a given node belong to the same class
 - There are no remaining attributes for further partitioning – **majority voting** is employed for classifying the leaf
 - There are no samples left

Brief Review of Entropy

■ Entropy (Information Theory)

- A measure of uncertainty associated with a random variable
- Calculation: For a discrete random variable Y taking m distinct values $\{y_1, \dots, y_m\}$,
 - $H(Y) = -\sum_{i=1}^m p_i \log(p_i)$, where $p_i = P(Y = y_i)$
- Interpretation:
 - Higher entropy $\Rightarrow$ higher uncertainty
 - Lower entropy $\Rightarrow$ lower uncertainty

■ Conditional Entropy

- $H(Y|X) = \sum_x p(x)H(Y|X = x)$

$m = 2$

Attribute Selection Measure: Information Gain (ID3)

- Select the attribute with the **highest information gain**
- Let p_i be the probability that an arbitrary tuple in D belongs to class C_i , estimated by **$|C_i, D|/|D|$**
- Expected information (entropy) needed to classify a tuple in D :

$$Info(D) = -\sum_{i=1}^m p_i \log_2(p_i)$$

- Information needed (after using A to split D into v partitions) to classify D :

$$Info_A(D) = \sum_{j=1}^v \frac{|D_j|}{|D|} \times Info(D_j)$$

- Information gained by branching on attribute A

$$Gain(A) = Info(D) - Info_A(D)$$

Attribute Selection: Information Gain

- Class P: buys_computer = “yes”
- Class N: buys_computer = “no”

$$Info_{age}(D) = \frac{5}{14} I(2,3) + \frac{4}{14} I(4,0) + \frac{5}{14} I(3,2) = 0.694$$

$$Info(D) = I(9,5) = -\frac{9}{14} \log_2\left(\frac{9}{14}\right) - \frac{5}{14} \log_2\left(\frac{5}{14}\right) = 0.940$$

age	p _i	n _i	I(p _i , n _i)
<=30	2	3	0.971
31...40	4	0	0
>40	3	2	0.971

$\frac{5}{14} I(2,3)$ means “age <=30” has 5 out of 14 samples, with 2 yes’es and 3 no’s. Hence

$$Gain(age) = Info(D) - Info_{age}(D) = 0.246$$

Similarly,

$$Gain(income) = 0.029$$

$$Gain(student) = 0.151$$

$$Gain(credit\_rating) = 0.048$$

age	income	student	credit_rating	buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
31...40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31...40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31...40	medium	no	excellent	yes
31...40	high	yes	fair	yes
>40	medium	no	excellent	no

Computing Information-Gain for Continuous-Valued Attributes

- Let attribute A be a continuous-valued attribute
- Must determine the **best split point** for A
 - Sort the value A in increasing order
 - Typically, the midpoint between each pair of adjacent values is considered as a possible *split point*
 - $(a_i + a_{i+1})/2$ is the midpoint between the values of a_i and a_{i+1}
 - The point with the *minimum expected information requirement* for A is selected as the split-point for A
- **Split:**
 - D_1 is the set of tuples in D satisfying $A \leq \text{split-point}$, and D_2 is the set of tuples in D satisfying $A > \text{split-point}$

Tahapan Algoritma Decision Tree (ID3)

1. Siapkan **data training**
2. Pilih **atribut sebagai akar**

$$Entropy(S) = \sum_{i=1}^n - p_i * \log_2 p_i$$

$$Gain(S, A) = Entropy(S) - \sum_{i=1}^n \frac{|S_i|}{|S|} * Entropy(S_i)$$

3. Buat **cabang untuk tiap-tiap nilai**
4. **Ulangi proses** untuk setiap cabang sampai semua kasus pada cabang memiliki kelas yg sama

1. Siapkan data training

No	OUTLOOK	TEMPERATURE	HUMIDITY	WINDY	PLAY
1	Sunny	Hot	High	FALSE	No
2	Sunny	Hot	High	TRUE	No
3	Cloudy	Hot	High	FALSE	Yes
4	Rainy	Mild	High	FALSE	Yes
5	Rainy	Cool	Normal	FALSE	Yes
6	Rainy	Cool	Normal	TRUE	Yes
7	Cloudy	Cool	Normal	TRUE	Yes
8	Sunny	Mild	High	FALSE	No
9	Sunny	Cool	Normal	FALSE	Yes
10	Rainy	Mild	Normal	FALSE	Yes
11	Sunny	Mild	Normal	TRUE	Yes
12	Cloudy	Mild	High	TRUE	Yes
13	Cloudy	Hot	Normal	FALSE	Yes
14	Rainy	Mild	High	TRUE	No

2. Pilih atribut sebagai akar

- Untuk memilih atribut akar, didasarkan pada nilai **Gain tertinggi** dari atribut-atribut yang ada. Untuk mendapatkan nilai Gain, harus ditentukan terlebih dahulu nilai Entropy

- Rumus Entropy:
$$Entropy(S) = \sum_{i=1}^n - p_i * \log_2 p_i$$

- S = Himpunan Kasus
- n = Jumlah Partisi S
- p_i = Proporsi dari S_i terhadap S

- Rumus Gain:
$$Gain(S, A) = Entropy(S) - \sum_{i=1}^n \frac{|S_i|}{|S|} * Entropy(S_i)$$

- S = Himpunan Kasus
- A = Atribut
- n = Jumlah Partisi Atribut A
- $|S_i|$ = Jumlah Kasus pada partisi ke- i
- $|S|$ = Jumlah Kasus dalam S

Perhitungan Entropy dan Gain Akar

NODE			Jml Kasus (S)	Tidak (S_1)	Ya (S_2)	Entropy	Gain
1	TOTAL						
	OUTLOOK						
		CLOUDY					
		RAINY					
		SUNNY					
	TEMPERATURE						
		COOL					
		HOT					
		MILD					
	HUMIDITY						
		HIGH					
		NORMAL					
	WINDY						
		FALSE					
		TRUE					

Penghitungan Entropy Akar

- Entropy **Total**

$$Entropy(Total) = (-\frac{4}{14} * \log_2(\frac{4}{14})) + (-\frac{10}{14} * \log_2(\frac{10}{14}))$$

$$Entropy(Total) = 0.863120569$$

- Entropy (**Outlook**)

$$Entropy(Cloudy) = (-\frac{0}{4} * \log_2(\frac{0}{4})) + (-\frac{4}{4} * \log_2(\frac{4}{4})) = 0.000000000$$

$$Entropy(Rainy) = (-\frac{1}{5} * \log_2(\frac{1}{5})) + (-\frac{4}{5} * \log_2(\frac{4}{5})) = 0.721928095$$

$$Entropy(Sunny) = (-\frac{3}{5} * \log_2(\frac{3}{5})) + (-\frac{2}{5} * \log_2(\frac{2}{5})) = 0.970950594$$

- Entropy (**Temperature**)

$$Entropy(Cool) = (-\frac{0}{4} * \log_2(\frac{0}{4})) + (-\frac{4}{4} * \log_2(\frac{4}{4})) = 0.000000000$$

$$Entropy(Hot) = (-\frac{2}{4} * \log_2(\frac{2}{4})) + (-\frac{2}{4} * \log_2(\frac{2}{4})) = 1.000000000$$

$$Entropy(Mild) = (-\frac{2}{6} * \log_2(\frac{2}{6})) + (-\frac{4}{6} * \log_2(\frac{4}{6})) = 0.918295834$$

- Entropy (**Humidity**)

$$Entropy(High) = (-\frac{4}{7} * \log_2(\frac{4}{7})) + (-\frac{3}{7} * \log_2(\frac{3}{7})) = 0.985228136$$

$$Entropy(Normal) = (-\frac{0}{7} * \log_2(\frac{0}{7})) + (-\frac{7}{7} * \log_2(\frac{7}{7})) = 0.000000000$$

- Entropy (**Windy**)

$$Entropy(False) = (-\frac{2}{8} * \log_2(\frac{2}{8})) + (-\frac{6}{8} * \log_2(\frac{6}{8})) = 0.811278124$$

$$Entropy(True) = (-\frac{4}{6} * \log_2(\frac{4}{6})) + (-\frac{2}{6} * \log_2(\frac{2}{6})) = 0.918295834$$

Penghitungan Entropy Akar

NODE	ATRIBUT		JML KASUS (S)	YA (Si)	TIDAK (Si)	ENTROPY	GAIN

Penghitungan Gain Akar

$$Gain(Total, Outlook) = Entropy(Total) - \sum_{i=1}^n \frac{|Outlook_i|}{|Total|} * Entropy(Outlook_i)$$

$$Gain(Total, Outlook) = 0.863120569 - \left(\left(\frac{4}{14} * 0.000000000 \right) + \left(\frac{5}{14} * 0.721928095 \right) + \left(\frac{5}{14} * 0.970950594 \right) \right)$$

$$Gain(Total, Outlook) = 0.258521037$$

$$Gain(Total, Temperature) = Entropy(Total) - \sum_{i=1}^n \frac{|Temperature_i|}{|Total|} * Entropy(Temperature_i)$$

$$Gain(Total, Temperature) = 0.863120569 - \left(\left(\frac{4}{14} * 0.000000000 \right) + \left(\frac{4}{14} * 1.000000000 \right) + \left(\frac{6}{14} * 0.918295834 \right) \right)$$

$$Gain(Total, Temperature) = 0.183850925$$

$$Gain(Total, Humidity) = Entropy(Total) - \sum_{i=1}^n \frac{|Humidity_i|}{|Total|} * Entropy(Humidity_i)$$

$$Gain(Total, Humidity) = 0.863120569 - \left(\left(\frac{7}{14} * 0.985228136 \right) + \left(\frac{7}{14} * 0.000000000 \right) \right)$$

$$Gain(Total, Humidity) = 0.370506501$$

$$Gain(Total, Windy) = Entropy(Total) - \sum_{i=1}^n \frac{|Windy_i|}{|Total|} * Entropy(Windy_i)$$

$$Gain(Total, Windy) = 0.863120569 - \left(\left(\frac{8}{14} * 0.811278124 \right) + \left(\frac{6}{14} * 0.918295834 \right) \right)$$

$$Gain(Total, Windy) = 0.005977711$$

Penghitungan Gain Akar

NODE	ATRIBUT		JML KASUS (S)	YA (Si)	TIDAK (Si)	ENTROPY	GAIN
1	TOTAL		14	10	4	0,86312	
	OUTLOOK						0,25852
		CLOUDY	4	4	0	0	
		RAINY	5	4	1	0,72193	
		SUNNY	5	2	3	0,97095	
	TEMPERATURE						0,18385
		COOL	4	0	4	0	
		HOT	4	2	2	1	
		MILD	6	2	4	0,91830	
	HUMADITY						0,37051
		HIGH	7	4	3	0,98523	
		NORMAL	7	7	0	0	
	WINDY						0,00598
		FALSE	8	2	6	0,81128	
		TRUE	6	4	2	0,91830	

Gain Tertinggi Sebagai Akar

- Dari hasil pada Node 1, dapat diketahui bahwa atribut dengan Gain tertinggi adalah **HUMIDITY** yaitu sebesar **0.37051**
 - Dengan demikian **HUMIDITY** dapat menjadi **node akar**
- Ada 2 nilai atribut dari HUMIDITY yaitu HIGH dan NORMAL. Dari kedua nilai atribut tersebut, nilai atribut NORMAL sudah **mengklasifikasikan kasus menjadi 1** yaitu keputusan-nya **Yes**, sehingga tidak perlu dilakukan perhitungan lebih lanjut
 - Tetapi untuk nilai atribut **HIGH** masih perlu dilakukan perhitungan lagi

2. Buat cabang untuk tiap-tiap nilai

- Untuk memudahkan, dataset di filter dengan mengambil data yang memiliki kelembaban HUMADITY=HIGH untuk membuat table Node 1.1

OUTLOOK	TEMPERATURE	HUMIDITY	WINDY	PLAY
Sunny	Hot	High	FALSE	No
Sunny	Hot	High	TRUE	No
Cloudy	Hot	High	FALSE	Yes
Rainy	Mild	High	FALSE	Yes
Sunny	Mild	High	FALSE	No
Cloudy	Mild	High	TRUE	Yes
Rainy	Mild	High	TRUE	No

Perhitungan Entropi Dan Gain Cabang

NODE	ATRIBUT		JML KASUS (S)	YA (Si)	TIDAK (Si)	ENTROPY	GAIN
1.1	HUMADITY		7	3	4	0,98523	
	OUTLOOK						0,69951
		CLOUDY	2	2	0	0	
		RAINY	2	1	1	1	
		SUNNY	3	0	3	0	
	TEMPERATURE						0,02024
		COOL	0	0	0	0	
		HOT	3	1	2	0,91830	
		MILD	4	2	2	1	
	WINDY						0,02024
		FALSE	4	2	2	1	
		TRUE	3	1	2	0,91830	

Gain Tertinggi Sebagai Node 1.1

- Dari hasil pada Tabel Node 1.1, dapat diketahui bahwa atribut dengan Gain tertinggi adalah **OUTLOOK** yaitu sebesar **0.69951**
 - Dengan demikian **OUTLOOK** dapat menjadi node kedua
- Atribut CLOUDY = YES dan SUNNY= NO sudah **mengklasifikasikan kasus menjadi 1 keputusan**, sehingga tidak perlu dilakukan perhitungan lebih lanjut
 - Tetapi untuk nilai atribut **RAINY** masih perlu dilakukan perhitungan lagi

3. Ulangi proses untuk setiap cabang sampai semua kasus pada cabang memiliki kelas yg sama

OUTLOOK	TEMPERATURE	HUMIDITY	WINDY	PLAY
Rainy	Mild	High	FALSE	Yes
Rainy	Mild	High	TRUE	No

NODE	ATRIBUT		JML KASUS (S)	YA (Si)	TIDAK (Si)	ENTROPY	GAIN
1.2	HUMADITY HIGH & OUTLOOK RAINY		2	1	1	1	
	TEMPERATURE						0
		COOL	0	0	0	0	
		HOT	0	0	0	0	
		MILD	2	1	1	1	
	WINDY						1
		FALSE	1	1	0	0	
		TRUE	1	0	1	0	

Gain Tertinggi Sebagai Node 1.1.2

- Dari tabel, **Gain Tertinggi adalah WINDY** dan menjadi node cabang dari atribut RAINY
- Karena **semua kasus sudah masuk dalam kelas**
 - Jadi, pohon keputusan pada Gambar merupakan **pohon keputusan terakhir yang terbentuk**

Decision Tree Induction: An Example

- Training data set:
Buys_computer

age	income	student	credit rating	buys computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
31...40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31...40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31...40	medium	no	excellent	yes
31...40	high	yes	fair	yes
>40	medium	no	excellent	no

Gain Ratio for Attribute Selection (C4.5)

- Information gain measure is **biased towards attributes with a large number** of values
- C4.5 (a successor of ID3) uses **gain ratio to overcome the problem** (normalization to information gain)

$$SplitInfo_A(D) = - \sum_{j=1}^v \frac{|D_j|}{|D|} \times \log_2 \left(\frac{|D_j|}{|D|} \right)$$

- $GainRatio(A) = Gain(A)/SplitInfo(A)$
- Ex. $SplitInfo_{income}(D) = -\frac{4}{14} \times \log_2 \left(\frac{4}{14} \right) - \frac{6}{14} \times \log_2 \left(\frac{6}{14} \right) - \frac{4}{14} \times \log_2 \left(\frac{4}{14} \right) = 1.557$
 - $gain\_ratio(income) = 0.029/1.557 = 0.019$
- The attribute with the **maximum gain ratio** is selected as the **splitting attribute**

Gini Index (CART)

- If a data set D contains examples from n classes, gini index, $gini(D)$ is defined as

$$gini(D) = 1 - \sum_{j=1}^n p_j^2$$

where p_j is the relative frequency of class j in D

- If a data set D is split on A into two subsets D_1 and D_2 , the gini index $gini_A(D)$ is defined as

$$gini_A(D) = \frac{|D_1|}{|D|} gini(D_1) + \frac{|D_2|}{|D|} gini(D_2)$$

- Reduction in Impurity:

$$\Delta gini(A) = gini(D) - gini_A(D)$$

- The attribute provides the smallest $gini_{split}(D)$ (or the largest reduction in impurity) is chosen to split the node (*need to enumerate all the possible splitting points for each attribute*)

Computation of Gini Index

- Ex. D has 9 tuples in $\text{buys\_computer} = \text{"yes"}$ and 5 in "no"

$$\text{gini}(D) = 1 - \left(\frac{9}{14}\right)^2 - \left(\frac{5}{14}\right)^2 = 0.459$$

- Suppose the attribute income partitions D into 10 in $D_1: \{\text{low}, \text{medium}\}$ and 4 in D_2

$$\begin{aligned}\text{gini}_{\text{income} \in \{\text{low}, \text{medium}\}}(D) &= \left(\frac{10}{14}\right) \text{Gini}(D_1) + \left(\frac{4}{14}\right) \text{Gini}(D_2) \\ &= \frac{10}{14} \left(1 - \left(\frac{7}{10}\right)^2 - \left(\frac{3}{10}\right)^2\right) + \frac{4}{14} \left(1 - \left(\frac{2}{4}\right)^2 - \left(\frac{2}{4}\right)^2\right) \\ &= 0.443 \\ &= \text{Gini}_{\text{income} \in \{\text{high}\}}(D).\end{aligned}$$

$\text{Gini}_{\{\text{low}, \text{high}\}}$ is 0.458; $\text{Gini}_{\{\text{medium}, \text{high}\}}$ is 0.450. Thus, split on the $\{\text{low}, \text{medium}\}$ (and $\{\text{high}\}$) since it has the **lowest Gini index**

- All attributes are **assumed continuous-valued**
- May need other tools, e.g., clustering, to **get the possible split values**
- Can be **modified for categorical attributes**

Comparing Attribute Selection Measures

The three measures, in general, return good results but

- **Information gain:**

- biased towards **multivalued attributes**

- **Gain ratio:**

- tends to prefer **unbalanced splits** in which one partition is much smaller than the others

- **Gini index:**

- biased to **multivalued attributes**
- has difficulty when # of classes is large
- tends to favor tests that result in **equal-sized partitions** and purity in both partitions

Other Attribute Selection Measures

- **CHAID**: a popular decision tree algorithm, measure based on χ^2 test for independence
- **C-SEP**: performs better than info. gain and gini index in certain cases
- **G-statistic**: has a close approximation to χ^2 distribution
- **MDL (Minimal Description Length) principle** (i.e., the simplest solution is preferred):
 - The best tree as the one that requires the fewest # of bits to both (1) encode the tree, and (2) encode the exceptions to the tree
- Multivariate splits (partition based on multiple variable combinations)
 - **CART**: finds multivariate splits based on a linear comb. of attrs.
- Which attribute selection measure is the best?
 - Most give good results, none is significantly superior than others

Overfitting and Tree Pruning

- **Overfitting**: An induced tree may overfit the training data
 - **Too many branches**, some may reflect anomalies due to noise or outliers
 - **Poor accuracy** for unseen samples
- Two approaches to **avoid overfitting**
 1. **Prepruning**: *Halt tree construction early* - do not split a node if this would result in the goodness measure falling below a threshold
 - Difficult to choose an appropriate threshold
 2. **Postpruning**: *Remove branches from a “fully grown” tree*
 - get a sequence of progressively pruned trees
 - Use a set of data different from the training data to decide which is the “best pruned tree”

Row No.	Play	Outlook	Temperature	Humidity	Windy
1	no	sunny	hot	high	false
2	no	sunny	hot	high	true
3	yes	cloudy	hot	high	false
4	yes	rainy	mild	high	false
5	yes	rainy	cool	normal	false
6	yes	rainy	cool	normal	true
7	yes	cloudy	cool	normal	true
8	no	sunny	mild	high	false
9	yes	sunny	cool	normal	false
10	yes	rainy	mild	normal	false
11	yes	sunny	mild	normal	true
12	yes	cloudy	mild	high	true
13	yes	cloudy	hot	normal	false
14	no	rainy	mild	high	true

Pruning

Why is decision tree induction popular?

- Relatively faster learning speed (than other classification methods)
- Convertible to simple and easy to understand classification rules
- Can use SQL queries for accessing databases
- Comparable classification accuracy with other methods

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses 2nd Edition, 2016, **Chapter 10 (Decision Tree)**, p 195-217
- Datasets:
 - **eReaderAdoption-Training.csv**
 - **eReaderAdoption-Scoring.csv**
- Analisis **peran metode pruning** pada decision tree dan hubungannya dengan **nilai confidence**
- Analisis **jenis decision tree** apa saja yang digunakan dan mengapa perlu dilakukan pada dataset tersebut

1 Business Understanding

Motivation:

- Richard works for a large online retailer
- His company is **launching a tablet** soon, and he want to **maximize the effectiveness** of his marketing
- They have a large number of customers, many of whom have purchased digital devices and other services previously
- Richard has noticed that **certain types of people** were anxious to get new devices as soon as they became available, while other folks seemed content to wait to buy their electronic gadgets later
- He's wondering **what makes some people motivated to buy** something as soon as it comes out, while others are less driven to have the product right away

Objectives:

- To mine the customers' consumer behaviors on the web site, in order to figure out which customers will buy the new tablet **early**, which ones will buy **next**, and which ones will buy **later on**

Latihan

- Lakukan **training** pada data eReader Adoption (eReader-Training.csv) dengan menggunakan DT dengan 3 alternative **criterion** (Gain Ratio, Information Gain dan Gini Index)
- Ujicoba masing-masing split criterion baik menggunakan pruning atau tidak
- Lakukan pengujian dengan menggunakan 10-fold X Validation
- Dari model terbaik, tentukan **faktor (atribut) apa saja yang berpengaruh** pada tingkat adopsi eReader

	DTGR	DTIG	DTGI	DTGR+Pr	DTIG+Pr	DTGI+Pr
Accuracy				58.39	51.01	31.01

Latihan

- Lakukan feature selection dengan **Forward Selection** untuk ketiga algoritma di atas
- Lakukan pengujian dengan menggunakan 10-fold X Validation
- Dari model terbaik, tentukan **faktor (atribut) apa saja yang berpengaruh** pada tingkat adopsi eReader

	DTGR	DTIG	DTGI	DTGR+FS	DTIG+FS	DTGI+FS
Accuracy	58.39	51.01	31.01	61.41	56.73	31.01

4.1.2 Bayesian Classification

Bayesian Classification: Why?

- A **statistical classifier**: performs probabilistic prediction, i.e., predicts class membership probabilities
- **Foundation**: Based on Bayes' Theorem.
- **Performance**: A simple Bayesian classifier, naïve Bayesian classifier, has comparable performance with decision tree and selected neural network classifiers
- **Incremental**: Each training example can incrementally increase/decrease the probability that a hypothesis is correct — prior knowledge can be combined with observed data
- **Standard**: Even when Bayesian methods are computationally intractable, they can provide a standard of optimal decision making against which other methods can be measured

Bayes' Theorem: Basics

- Total probability Theorem:
$$P(B) = \sum_{i=1}^M P(B|A_i)P(A_i)$$
- Bayes' Theorem:
$$P(H|\mathbf{X}) = \frac{P(\mathbf{X}|H)P(H)}{P(\mathbf{X})} = P(\mathbf{X}|H) \times P(H) / P(\mathbf{X})$$
 - Let $\mathbf{X}$ be a data sample ("*evidence*"): class label is unknown
 - Let H be a *hypothesis* that $\mathbf{X}$ belongs to class C
 - Classification is to determine $P(H|\mathbf{X})$, (i.e., *posteriori probability*): the probability that the hypothesis holds given the observed data sample $\mathbf{X}$
 - $P(H)$ (*prior probability*): the initial probability
 - E.g., $\mathbf{X}$ will buy computer, regardless of age, income, ...
 - $P(\mathbf{X})$: probability that sample data is observed
 - $P(\mathbf{X}|H)$ (*likelihood*): the probability of observing the sample $\mathbf{X}$, given that the hypothesis holds
 - E.g., Given that $\mathbf{X}$ will buy computer, the prob. that $\mathbf{X}$ is 31..40, medium income

Prediction Based on Bayes' Theorem

- Given training data $\mathbf{X}$, *posteriori probability of a hypothesis* H , $P(H|\mathbf{X})$, follows the Bayes' theorem

$$P(H|\mathbf{X}) = \frac{P(\mathbf{X}|H)P(H)}{P(\mathbf{X})} = P(\mathbf{X}|H) \times P(H) / P(\mathbf{X})$$

- Informally, this can be viewed as
posteriori = likelihood x prior/evidence
- Predicts $\mathbf{X}$ belongs to C_i iff the probability $P(C_i|\mathbf{X})$ is the highest among all the $P(C_k|\mathbf{X})$ for all the k classes
- Practical difficulty: It **requires initial knowledge of many probabilities**, involving significant computational cost

Classification is to Derive the Maximum Posteriori

- Let D be a training set of tuples and their associated class labels, and each tuple is represented by an n -D attribute vector $\mathbf{X} = (x_1, x_2, \dots, x_n)$
- Suppose there are m classes $C_1, C_2, \dots, C_m$.
- Classification is to derive the maximum posteriori, i.e., the maximal $P(C_i | \mathbf{X})$
- This can be derived from Bayes' theorem

$$P(C_i | \mathbf{X}) = \frac{P(\mathbf{X} | C_i)P(C_i)}{P(\mathbf{X})}$$

- Since $P(\mathbf{X})$ is constant for all classes, only

needs to be maximized

$$P(C_i | \mathbf{X}) = P(\mathbf{X} | C_i)P(C_i)$$

Naïve Bayes Classifier

- A simplified assumption: **attributes are conditionally independent** (i.e., no dependence relation between attributes):

$$P(\mathbf{X} | C_i) = \prod_{k=1}^n P(x_k | C_i) = P(x_1 | C_i) \times P(x_2 | C_i) \times \dots \times P(x_n | C_i)$$

- This greatly reduces the computation cost: **Only counts the class distribution**
- If A_k is categorical, $P(x_k | C_i)$ is the # of tuples in C_i having value x_k for A_k divided by $|C_{i,D}|$ (# of tuples of C_i in D)
- If A_k is continuous-valued, $P(x_k | C_i)$ is usually computed based on Gaussian distribution with a mean μ and standard deviation σ

$$g(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

and $P(x_k | C_i)$ is

$$P(\mathbf{X} | C_i) = g(x_k, \mu_{C_i}, \sigma_{C_i})$$

Naïve Bayes Classifier: Training Dataset

Class:

C_1 :buys_computer = 'yes'

C_2 :buys_computer = 'no'

Data to be classified:

$X = (\text{age} \leq 30,$
 $\text{income} = \text{medium},$
 $\text{student} = \text{yes},$
 $\text{credit\_rating} = \text{fair})$

$X \rightarrow \text{buy computer?}$

age	income	student	credit_rating	buys_computer
≤ 30	high	no	fair	no
≤ 30	high	no	excellent	no
31...40	high	no	fair	yes
> 40	medium	no	fair	yes
> 40	low	yes	fair	yes
> 40	low	yes	excellent	no
31...40	low	yes	excellent	yes
≤ 30	medium	no	fair	no
≤ 30	low	yes	fair	yes
> 40	medium	yes	fair	yes
≤ 30	medium	yes	excellent	yes
31...40	medium	No	excellent	yes
31...40	high	Yes	fair	yes
> 40	medium	No	excellent	no

Naïve Bayes Classifier: An Example

age	income	student	credit rating	buys computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
31...40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31...40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31...40	medium	no	excellent	yes
31...40	high	yes	fair	yes
>40	medium	no	excellent	no

- $P(C_i)$: $P(\text{buys\_computer} = \text{"yes"}) = 9/14 = 0.643$

$$P(\text{buys\_computer} = \text{"no"}) = 5/14 = 0.357$$

- Compute $P(X|C_i)$ for each class

$$P(\text{age} = \text{"<=30"} \mid \text{buys\_computer} = \text{"yes"}) = 2/9 = 0.222$$

$$P(\text{age} = \text{"<= 30"} \mid \text{buys\_computer} = \text{"no"}) = 3/5 = 0.6$$

$$P(\text{income} = \text{"medium"} \mid \text{buys\_computer} = \text{"yes"}) = 4/9 = 0.444$$

$$P(\text{income} = \text{"medium"} \mid \text{buys\_computer} = \text{"no"}) = 2/5 = 0.4$$

$$P(\text{student} = \text{"yes"} \mid \text{buys\_computer} = \text{"yes"}) = 6/9 = 0.667$$

$$P(\text{student} = \text{"yes"} \mid \text{buys\_computer} = \text{"no"}) = 1/5 = 0.2$$

$$P(\text{credit\_rating} = \text{"fair"} \mid \text{buys\_computer} = \text{"yes"}) = 6/9 = 0.667$$

$$P(\text{credit\_rating} = \text{"fair"} \mid \text{buys\_computer} = \text{"no"}) = 2/5 = 0.4$$

- $X = (\text{age} \leq 30, \text{income} = \text{medium}, \text{student} = \text{yes}, \text{credit\_rating} = \text{fair})$

$$P(X|C_i): P(X \mid \text{buys\_computer} = \text{"yes"}) = 0.222 \times 0.444 \times 0.667 \times 0.667 = 0.044$$

$$P(X \mid \text{buys\_computer} = \text{"no"}) = 0.6 \times 0.4 \times 0.2 \times 0.4 = 0.019$$

$$P(X|C_i) * P(C_i): P(X \mid \text{buys\_computer} = \text{"yes"}) * P(\text{buys\_computer} = \text{"yes"}) = 0.028$$

$$P(X \mid \text{buys\_computer} = \text{"no"}) * P(\text{buys\_computer} = \text{"no"}) = 0.007$$

Therefore, X belongs to class (**"buys_computer = yes"**)

Tahapan Algoritma Naïve Bayes

1. Baca Data Training
2. Hitung jumlah class
3. Hitung jumlah kasus yang sama dengan class yang sama
4. Kalikan semua nilai hasil sesuai dengan data X yang dicari class-nya

1. Baca Data Training

Outlook	Temperature	Humidity	Windy	Play
Sunny	hot	high	false	no
Sunny	hot	high	true	no
Overcast	hot	high	false	yes
Rainy	mild	high	false	yes
Rainy	cool	normal	false	yes
Rainy	cool	normal	true	no
Overcast	cool	normal	true	yes
Sunny	mild	high	false	no
Sunny	cool	normal	false	yes
Rainy	mild	normal	false	yes
Sunny	mild	normal	true	yes
Overcast	mild	high	true	yes
Overcast	hot	normal	false	yes
Rainy	mild	high	true	no

Teorema Bayes

$$P(H | \mathbf{X}) = \frac{P(\mathbf{X} | H)P(H)}{P(\mathbf{X})} = P(\mathbf{X} | H) \times P(H) / P(\mathbf{X})$$

- $\mathbf{X}$ → Data dengan class yang belum diketahui
- H → Hipotesis data X yang merupakan suatu class yang lebih spesifik
- $P(H|\mathbf{X})$ → Probabilitas hipotesis H berdasarkan kondisi X (*posteriori probability*)
- $P(H)$ → Probabilitas hipotesis H (*prior probability*)
- $P(\mathbf{X}|H)$ → Probabilitas X berdasarkan kondisi pada hipotesis H
- $P(\mathbf{X})$ → Probabilitas X

2. Hitung jumlah class/label

- Terdapat 2 class dari data training tersebut, yaitu:
 - C1 (Class 1) $\rightarrow$ Play = yes $\rightarrow$ 9 record
 - C2 (Class 2) $\rightarrow$ Play = no $\rightarrow$ 5 record
 - Total = 14 record
- Maka:
 - $P(C1) = 9/14 = 0.642857143$
 - $P(C2) = 5/14 = 0.357142857$
- Pertanyaan:
 - Data $X = (\text{outlook}=\text{rainy}, \text{temperature}=\text{cool}, \text{humidity}=\text{high}, \text{windy}=\text{true})$
 - Main golf atau tidak?

3. Hitung jumlah kasus yang sama dengan class yang sama

- Untuk $P(C_i)$ yaitu $P(C1)$ dan $P(C2)$ sudah diketahui hasilnya di langkah sebelumnya.
- Selanjutnya Hitung $P(X/C_i)$ untuk $i = 1$ dan 2
 - $P(\text{outlook}=\text{"sunny"} \mid \text{play}=\text{"yes"}) = 2/9 = 0.2222222222$
 - $P(\text{outlook}=\text{"sunny"} \mid \text{play}=\text{"no"}) = 3/5 = 0.6$
 - $P(\text{outlook}=\text{"overcast"} \mid \text{play}=\text{"yes"}) = 4/9 = 0.4444444444$
 - $P(\text{outlook}=\text{"overcast"} \mid \text{play}=\text{"no"}) = 0/5 = 0$
 - $P(\text{outlook}=\text{"rainy"} \mid \text{play}=\text{"yes"}) = 3/9 = 0.3333333333$
 - $P(\text{outlook}=\text{"rainy"} \mid \text{play}=\text{"no"}) = 2/5 = 0.4$

3. Hitung jumlah kasus yang sama dengan class yang sama

- Jika semua atribut dihitung, maka didapat hasil akhirnya seperti berikut ini:

Atribut	Parameter	No	Yes
Outlook	value=sunny	0.6	0.2222222222222222
Outlook	value=cloudy	0.0	0.4444444444444444
Outlook	value=rainy	0.4	0.3333333333333333
Temperature	value=hot	0.4	0.2222222222222222
Temperature	value=mild	0.4	0.4444444444444444
Temperature	value=cool	0.2	0.3333333333333333
Humidity	value=high	0.8	0.3333333333333333
Humidity	value=normal	0.2	0.6666666666666666
Windy	value=false	0.4	0.6666666666666666
Windy	value=true	0.6	0.3333333333333333

4. Kalikan semua nilai hasil sesuai dengan data X yang dicari class-nya

- Pertanyaan:
 - Data X = (outlook=rainy, temperature=cool, humidity=high, windy=true)
 - Main Golf atau tidak?
- Kalikan semua nilai hasil dari data X
 - $P(X | \text{play} = \text{"yes"}) = 0.3333333333 * 0.3333333333 * 0.3333333333 * 0.3333333333 = 0.012345679$
 - $P(X | \text{play} = \text{"no"}) = 0.4 * 0.2 * 0.8 * 0.6 = 0.0384$
 - $P(X | \text{play} = \text{"yes"}) * P(C1) = 0.012345679 * 0.642857143 = 0.007936508$
 - $P(X | \text{play} = \text{"no"}) * P(C2) = 0.0384 * 0.357142857 = \mathbf{0.013714286}$
- Nilai "no" lebih besar dari nilai "yes" maka class dari data X tersebut adalah **No**

Avoiding the Zero-Probability Problem

- Naïve Bayesian prediction requires each conditional prob. be **non-zero**. Otherwise, the predicted prob. will be zero

$$P(X | C_i) = \prod_{k=1}^n P(x_k | C_i)$$

- Ex. Suppose a dataset with 1000 tuples, income=low (0), income= medium (990), and income = high (10)
- Use **Laplacian correction** (or Laplacian estimator)
 - *Adding 1 to each case*
Prob(income = low) = 1/1003
Prob(income = medium) = 991/1003
Prob(income = high) = 11/1003
 - The “corrected” prob. estimates are close to their “uncorrected” counterparts

Naïve Bayes Classifier: Comments

- **Advantages**

- Easy to implement
- Good results obtained in most of the cases

- **Disadvantages**

- Assumption: **class conditional independence**, therefore loss of accuracy
- Practically, **dependencies exist among variables**, e.g.:
 - Hospitals Patients Profile: age, family history, etc.
 - Symptoms: fever, cough etc.,
 - Disease: lung cancer, diabetes, etc.
- Dependencies among these **cannot be modeled by Naïve Bayes Classifier**
- How to deal with these dependencies? **Bayesian Belief Networks**

4.1.3 Neural Network

Neural Network

- Neural Network adalah suatu model yang dibuat untuk **meniru fungsi belajar yang dimiliki otak manusia** atau jaringan dari sekelompok unit pemroses kecil yang dimodelkan berdasarkan jaringan saraf manusia

Neural Network

- Model Perceptron adalah model jaringan yang terdiri dari beberapa unit masukan (ditambah dengan sebuah bias), dan memiliki sebuah unit keluaran
- Fungsi aktivasi bukan hanya merupakan fungsi biner (0,1) melainkan bipolar (1,0,-1)
- Untuk suatu harga *threshold* θ yang ditentukan:

$$F(net) = \begin{cases} 1 & \text{Jika } net > \theta \\ 0 & \text{Jika } -\theta \leq net \leq \theta \\ -1 & \text{Jika } net < -\theta \end{cases}$$

Fungsi Aktivasi

Macam fungsi aktivasi yang dipakai untuk mengaktifkan *net* diberbagai jenis neural network:

1. Aktivasi linear, Rumus: $y = \text{sign}(v) = v$

2. Aktivasi step, Rumus:

$$y = \text{sign}(v) = \begin{cases} 1 & \text{Jika } v \geq T \\ -1 & \text{Jika } v < T \end{cases}$$

3. Aktivasi sigmoid biner, Rumus:

$$y = \frac{1}{1 + e^{-v}}$$

4. Aktivasi sigmoid bipolar, Rumus:

$$y = \frac{2}{1 + e^{-v}} - 1$$

Tahapan Algoritma Perceptron

1. Inisialisasi semua **bobot dan bias** (umumnya $w_i = b = 0$)
2. Selama ada element vektor masukan yang **respon unit keluarannya tidak sama dengan target**, lakukan:

2.1 **Set aktivasi unit** masukan $x_i = S_i$ ($i = 1, \dots, n$)

2.2 **Hitung respon unit keluaran**: $net = \sum_i x_i w_i + b$

$$F(net) = \begin{cases} 1 & \text{Jika } net > \theta \\ 0 & \text{Jika } -\theta \leq net \leq \theta \\ -1 & \text{Jika } net < -\theta \end{cases}$$

2.3 **Perbaiki bobot pola yang mengandung kesalahan** menurut persamaan:

W_i (baru) = w_i (lama) + Δw ($i = 1, \dots, n$) dengan $\Delta w = \alpha t x_i$

B (baru) = b (lama) + Δb dengan $\Delta b = \alpha t$

Dimana: α = Laju pembelajaran (Learning rate) yang ditentukan

θ = Threshold yang ditentukan

t = Target

2.4 **Ulangi iterasi sampai perubahan bobot ($\Delta w_n = 0$) tidak ada**

Studi Kasus

- Diketahui sebuah dataset kelulusan berdasarkan IPK untuk program S1:

Status	IPK	Semester
Lulus	2.9	1
Tidak Lulus	2.8	3
Tidak Lulus	2.3	5
Tidak lulus	2.7	6

- Jika ada mahasiswa **IPK 2.85 dan masih semester 1**, maka masuk ke kedalam manakah status tersebut ?

1: Inisialisasi Bobot

- Inisialisasi Bobot dan bias awal: $b = 0$ dan $bias = 1$

t	x1	x2
1	2,9	1
-1	2.8	3
-1	2.3	5
-1	2,7	6

2.1: Set aktivasi unit masukan

- Treshold (batasan), $\theta = 0$, yang artinya :

$$F(net) = \begin{cases} 1 & \text{Jika } net > 0 \\ 0 & \text{Jika } net = 0 \\ -1 & \text{Jika } net < 0 \end{cases}$$

2.2 - 2.3 Hitung Respon dan Perbaiki Bobot

- Hitung Response Keluaran iterasi 1
- Perbaiki bobot pola yang mengandung kesalahan

MASUKAN			TARGET		y=	PERUBAHAN BOBOT			BOBOT BARU		
X1	X2	1	t	NET	f(NET)	$\Delta W1$	$\Delta W2$	Δb	W1	W2	b
INISIALISASI									0	0	0
2,9	1	1	1	0	0	2,9	1	1	2,9	7	1
2,8	3	1	-1	8,12	1	-2,8	-3	-1	0,1	4	0
2,3	5	1	-1	0,23	1	-2,3	-5	-1	-2,2	-1	-1
2,7	6	1	-1	-5,94	-1	0	0	0	-2,2	-1	-1

2.4 Ulangi iterasi sampai perubahan bobot ($\Delta w_n = 0$) tidak ada (Iterasi 2)

- Hitung Response Keluaran iterasi 2
- Perbaiki bobot pola yang mengandung kesalahan

MASUKAN			TARGET		y=	PERUBAHAN BOBOT			BOBOT BARU		
X1	X2	1	t	NET	f(NET)	$\Delta W1$	$\Delta W2$	Δb	W1	W2	b
INISIALISASI									-2,2	-1	-1
2,9	1	1	1	-8,38	-1	2,9	1	1	0,7	0	0
2,8	3	1	-1	1,96	1	-2,8	-3	-1	-2,1	-3	-1
2,3	5	1	-1	-20,83	-1	0	0	0	-2,1	-3	-1
2,7	6	1	-1	-24,67	-1	0	0	0	-2,1	-3	-1

2.4 Ulangi iterasi sampai perubahan bobot ($\Delta w_n = 0$) tidak ada (Iterasi 3)

- Hitung Response Keluaran iterasi 3
- Perbaiki bobot pola yang mengandung kesalahan

MASUKAN			TARGET		y=	PERUBAHAN BOBOT			BOBOT BARU		
X1	X2	1	t	NET	f(NET)	$\Delta W1$	$\Delta W2$	Δb	W1	W2	b
INISIALISASI									-2,1	-3	-1
2,9	1	1	1	-10,09	-1	2,9	1	1	0,8	-2	0
2,8	3	1	-1	-3,76	-1	0	0	0	0,8	-2	0
2,3	5	1	-1	-8,16	-1	0	0	0	0,8	-2	0
2,7	6	1	-1	-9,84	-1	0	0	0	0,8	-2	0

- Untuk data IPK memiliki pola $0.8x - 2y = 0$ dapat dihitung prediksinya menggunakan bobot yang terakhir didapat:

$$V = X1 * W1 + X2 * W2 = 0,8 * 2,85 - 2 * 1 = 2,28 - 2 = 0,28$$

$$Y = \text{sign}(V) = \text{sign}(0,28) = 1 \text{ (Lulus)}$$

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses 2nd Edition, 2016, **Chapter 11 (Neural Network)**, p 219-228
- Dataset:
 - TeamValue-Training.csv
 - TeamValue-Scoring.csv
- Pahami model neural network yang dihasilkan, perhatikan ketebalan garis neuron yang menyambungkan antar node

1. Business Understanding

Motivation:

- Juan is a **performance analyst** for a major professional athletic team
- His team has been steadily improving over recent seasons, and heading into the coming season management believes that by **adding between two and four excellent players**, the team will have an outstanding shot at achieving the league championship
- They have tasked Juan with **identifying their best options from among a list of 59 players** that may be available to them
- All of these players have experience; some have played professionally before and some have years of experience as amateurs
- None are to be ruled out without being assessed for their potential ability to add star power and productivity to the existing team
- The executives Juan works for are anxious to get going on contacting the most promising prospects, so Juan needs to quickly evaluate these athletes' past performance and make recommendations based on his analysis

Objectives:

- To evaluate each of the 59 prospects' past statistical performance in order to help him formulate recommendations based on his analysis

Latihan

- Lakukan training dengan **neural network** untuk dataset **TeamValue-Training.csv**
- Gunakan **10-fold cross validation**
- Lakukan adjustment terhadap **hidden layer** dan **neuron size**, misal: hidden layer saya buat 3, neuron size masing-masing 5
- Apa yang terjadi, apakah ada peningkatan akurasi?

	NN	NN (HL 2, NS 3)	NN (HL 2, NS 5)	NN (HL 3, NS 3)	NN (HL 3, NS 5)	NN (HL 4, NS 3)	NN (HL 4, NS 5)
Accuracy							

Penentuan Hidden Layer

Hidden Layer	Capabilities
0	Only capable of representing linear separable functions or decisions
1	Can approximate any function that contains a continuous mapping from one finite space to another
2	Can represent an arbitrary decision boundary to arbitrary accuracy with rational activation functions and can approximate any smooth mapping to any accuracy

Penentuan Neuron Size

1. Trial and Error

2. Rule of Thumb:

- Between the size of the input layer and the size of the output layer
- $2/3$ the size of the input layer, plus the size of the output layer
- Less than twice the size of the input layer

3. Search Algorithm:

- Greedy
- Genetic Algorithm
- Particle Swarm Optimization
- etc

Techniques to Improve Classification Accuracy: Ensemble Methods

Ensemble Methods: Increasing the Accuracy

- **Ensemble methods**

- Use a **combination of models** to increase accuracy
- Combine a series of k learned models, $M_1, M_2, \dots, M_k$, with the aim of creating an improved model M^*

- **Popular ensemble methods**

- **Bagging**: averaging the prediction over a collection of classifiers
- **Boosting**: weighted vote with a collection of classifiers
- **Ensemble**: combining a set of heterogeneous classifiers

Bagging: Bootstrap Aggregation

- **Analogy:** Diagnosis based on multiple doctors' majority vote
- **Training**
 - Given a set D of d tuples, at each iteration i , a training set D_i of d tuples is sampled with replacement from D (i.e., bootstrap)
 - A classifier model M_i is learned for each training set D_i
- **Classification:** classify an unknown sample X
 - Each classifier M_i returns its class prediction
 - The bagged classifier M^* counts the votes and assigns the class with the most votes to X
- **Prediction:** can be applied to the prediction of continuous values by taking the average value of each prediction for a given test tuple
- **Accuracy**
 - Often significantly better than a single classifier derived from D
 - For noise data: not considerably worse, more robust
 - Proved improved accuracy in prediction

Boosting

- **Analogy:** Consult several doctors, based on a **combination of weighted diagnoses**—weight assigned based on the previous diagnosis accuracy
- How **boosting works?**
 1. **Weights** are assigned to each training tuple
 2. A series of k classifiers is iteratively learned
 3. After a classifier M_i is learned, the weights are updated to allow the subsequent classifier, M_{i+1} , to **pay more attention to the training tuples that were misclassified** by M_i
 4. The final **M^* combines the votes** of each individual classifier, where the weight of each classifier's vote is a function of its accuracy
- Boosting algorithm can be extended for numeric prediction
- **Comparing with bagging:** **Boosting tends to have greater accuracy**, but it also risks overfitting the model to misclassified data

Adaboost (Freund and Schapire, 1997)

1. Given a set of d class-labeled tuples, $(\mathbf{X}_1, y_1), \dots, (\mathbf{X}_d, y_d)$
2. Initially, all the weights of tuples are set the same ($1/d$)
3. Generate k classifiers in k rounds. At round i ,
 1. Tuples from D are sampled (with replacement) to form a training set D_i of the same size
 2. Each tuple's chance of being selected is based on its weight
 3. A classification model M_i is derived from D_i
 4. Its error rate is calculated using D_i as a test set
 5. If a tuple is misclassified, its weight is increased, o.w. it is decreased
4. Error rate: $\text{err}(\mathbf{X}_j)$ is the misclassification error of tuple $\mathbf{X}_j$. Classifier M_i error rate is the sum of the weights of the misclassified tuples:

$$\text{error}(M_i) = \sum_j^d w_j \times \text{err}(\mathbf{X}_j)$$

5. The weight of classifier M_i 's vote is $\log \frac{1 - \text{error}(M_i)}{\text{error}(M_i)}$

Random Forest (Breiman 2001)

- **Random Forest:**
 - Each classifier in the ensemble is a *decision tree* classifier and is generated using a random selection of attributes at each node to determine the split
 - During classification, each tree votes and the most popular class is returned
- Two **Methods to construct** Random Forest:
 1. **Forest-RI (*random input selection*)**: Randomly select, at each node, F attributes as candidates for the split at the node. The CART methodology is used to grow the trees to maximum size
 2. **Forest-RC (*random linear combinations*)**: Creates new attributes (or features) that are a linear combination of the existing attributes (reduces the correlation between individual classifiers)
- Comparable in accuracy to Adaboost, but **more robust to errors and outliers**
- Insensitive to the number of attributes selected for consideration at each split, and faster than bagging or boosting

Classification of Class-Imbalanced Data Sets

- **Class-imbalance problem**: Rare positive example but numerous negative ones, e.g., medical diagnosis, fraud, oil-spill, fault, etc.
- Traditional methods assume a balanced distribution of classes and equal error costs: **not suitable for class-imbalanced data**
- Typical **methods for imbalance data** in 2-class classification:
 1. **Oversampling**: re-sampling of data from positive class
 2. **Under-sampling**: randomly eliminate tuples from negative class
 3. **Threshold-moving**: moves the decision threshold, t , so that the rare class tuples are easier to classify, and hence, less chance of costly false negative errors
 4. **Ensemble techniques**: Ensemble multiple classifiers introduced above
- Still difficult for class imbalance problem on multiclass tasks

4.2 Algoritma Klastering

4.2.1 Partitioning Methods

4.2.2 Hierarchical Methods

4.2.3 Density-Based Methods

4.2.4 Grid-Based Methods

What is Cluster Analysis?

- **Cluster**: A collection of data objects
 - similar (or related) to one another within the same group
 - dissimilar (or unrelated) to the objects in other groups
- **Cluster analysis** (or *clustering*, *data segmentation*, ...)
 - Finding similarities between data according to the characteristics found in the data and grouping similar data objects into clusters
- **Unsupervised learning**: no predefined classes (i.e., *learning by observations* vs. learning by examples: supervised)
- Typical applications
 - As a **stand-alone tool** to get insight into data distribution
 - As a **preprocessing step** for other algorithms

Applications of Cluster Analysis

- Data **reduction**
 - **Summarization**: Preprocessing for regression, PCA, classification, and association analysis
 - **Compression**: Image processing: vector quantization
- Hypothesis generation and testing
- Prediction based on groups
 - Cluster & find characteristics/patterns for each group
- Finding K-nearest Neighbors
 - Localizing search to one or a small number of clusters
- **Outlier detection**: Outliers are often viewed as those “far away” from any cluster

Clustering: Application Examples

- **Biology**: taxonomy of living things: kingdom, phylum, class, order, family, genus and species
- **Information retrieval**: document clustering
- **Land use**: Identification of areas of similar land use in an earth observation database
- **Marketing**: Help marketers discover distinct groups in their customer bases, and then use this knowledge to develop targeted marketing programs
- **City-planning**: Identifying groups of houses according to their house type, value, and geographical location
- **Earth-quake studies**: Observed earth quake epicenters should be clustered along continent faults
- **Climate**: understanding earth climate, find patterns of atmospheric and ocean
- **Economic Science**: market research

Basic Steps to Develop a Clustering Task

- Feature selection
 - Select info concerning the task of interest
 - Minimal information redundancy
- Proximity measure
 - Similarity of two feature vectors
- Clustering criterion
 - Expressed via a cost function or some rules
- Clustering algorithms
 - Choice of algorithms
- Validation of the results
 - Validation test (also, *clustering tendency* test)
- Interpretation of the results
 - Integration with applications

Quality: What Is Good Clustering?

- A good clustering method will produce high quality clusters
 - high intra-class similarity: cohesive within clusters
 - low inter-class similarity: distinctive between clusters
- The quality of a clustering method depends on
 - the similarity measure used by the method
 - its implementation, and
 - Its ability to discover some or all of the hidden patterns

Measure the Quality of Clustering

- **Dissimilarity/Similarity metric**
 - Similarity is expressed in terms of a distance function, typically metric: $d(i, j)$
 - The definitions of **distance functions** are usually rather different for interval-scaled, boolean, categorical, ordinal ratio, and vector variables
 - Weights should be associated with different variables based on applications and data semantics
- **Quality of clustering:**
 - There is usually a separate “quality” function that measures the “goodness” of a cluster.
 - It is hard to define “similar enough” or “good enough”
 - The answer is typically highly subjective

Considerations for Cluster Analysis

- Partitioning criteria
 - Single level vs. hierarchical partitioning (often, multi-level hierarchical partitioning is desirable)
- Separation of clusters
 - Exclusive (e.g., one customer belongs to only one region) vs. non-exclusive (e.g., one document may belong to more than one class)
- Similarity measure
 - Distance-based (e.g., Euclidian, road network, vector) vs. connectivity-based (e.g., density or contiguity)
- Clustering space
 - Full space (often when low dimensional) vs. subspaces (often in high-dimensional clustering)

Requirements and Challenges

- Scalability
 - Clustering all the data instead of only on samples
- Ability to deal with different types of attributes
 - Numerical, binary, categorical, ordinal, linked, and mixture of these
- Constraint-based clustering
 - User may give inputs on constraints
 - Use domain knowledge to determine input parameters
- Interpretability and usability
- Others
 - Discovery of clusters with arbitrary shape
 - Ability to deal with noisy data
 - Incremental clustering and insensitivity to input order
 - High dimensionality

Major Clustering Approaches 1

- **Partitioning** approach:
 - Construct various partitions and then evaluate them by some criterion, e.g., minimizing the sum of square errors
 - Typical methods: **k-means**, k-medoids, CLARANS
- **Hierarchical** approach:
 - Create a hierarchical decomposition of the set of data (or objects) using some criterion
 - Typical methods: Diana, Agnes, BIRCH, CAMELEON
- **Density-based** approach:
 - Based on connectivity and density functions
 - Typical methods: DBSACN, OPTICS, DenClue
- **Grid-based** approach:
 - based on a multiple-level granularity structure
 - Typical methods: STING, WaveCluster, CLIQUE

Major Clustering Approaches 2

- **Model-based:**

- A model is hypothesized for each of the clusters and tries to find the best fit of that model to each other
- Typical methods: EM, SOM, COBWEB

- **Frequent** pattern-based:

- Based on the analysis of frequent patterns
- Typical methods: p-Cluster

- **User-guided** or constraint-based:

- Clustering by considering user-specified or application-specific constraints
- Typical methods: COD (obstacles), constrained clustering

- **Link-based** clustering:

- Objects are often linked together in various ways
- Massive links can be used to cluster objects: SimRank, LinkClus

4.2.1 Partitioning Methods

Partitioning Algorithms: Basic Concept

- **Partitioning method**: Partitioning a database ***D*** of ***n*** objects into a set of ***k*** clusters, such that the sum of squared distances is minimized (where c_i is the centroid or medoid of cluster C_i)

$$E = \sum_{i=1}^k \sum_{p \in C_i} (d(p, c_i))^2$$

- Given k , find a partition of k clusters that optimizes the chosen partitioning criterion
 - **Global optimal**: exhaustively enumerate all partitions
 - **Heuristic methods**: *k-means* and *k-medoids* algorithms
 - *k-means* (MacQueen'67, Lloyd'57/'82): Each cluster is represented by the center of the cluster
 - *k-medoids* or PAM (Partition around medoids) (Kaufman & Rousseeuw'87): Each cluster is represented by one of the objects in the cluster

The *K-Means* Clustering Method

- Given k , the *k-means* algorithm is implemented in four steps:
 1. Partition objects into k nonempty subsets
 2. Compute seed points as the centroids of the clusters of the current partitioning (the centroid is the center, i.e., *mean point*, of the cluster)
 3. Assign each object to the cluster with the nearest seed point
 4. Go back to Step 2, stop when the assignment does not change

An Example of K-Means Clustering

- Partition objects into k nonempty subsets
- Repeat
 - Compute centroid (i.e., mean point) for each partition
 - Assign each object to the cluster of its nearest centroid
- Until no change

Tahapan Algoritma k-Means

1. Pilih **jumlah kluster k** yang diinginkan
2. **Inisialisasi k pusat kluster** (centroid) secara random
3. **Tempatkan setiap data atau objek ke kluster terdekat**. Kedekatan dua objek ditentukan berdasar jarak. Jarak yang dipakai pada algoritma k-Means adalah *Euclidean distance* (d)

$$d_{Euclidean}(x, y) = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$$

- $x = x_1, x_2, \dots, x_n$, dan $y = y_1, y_2, \dots, y_n$ merupakan banyaknya n atribut(kolom) antara 2 record
4. **Hitung kembali pusat kluster** dengan keanggotaan kluster yang sekarang. Pusat kluster adalah rata-rata (mean) dari semua data atau objek dalam kluster tertentu
 5. **Tugaskan lagi setiap objek dengan memakai pusat kluster yang baru**. Jika **pusat kluster sudah tidak berubah lagi**, maka proses **pengkusteringan selesai**. Atau, **kembali lagi ke langkah nomor 3** sampai pusat kluster tidak berubah lagi (stabil) atau tidak ada penurunan yang signifikan dari nilai SSE (*Sum of Squared Errors*)

Contoh Kasus – Iterasi 1

Instances	X	Y
A	1	3
B	3	3
C	4	3
D	5	3
E	1	2
F	4	2
G	1	1
H	2	1

1. Tentukan jumlah kluster **k=2**
2. Tentukan centroid awal secara acak misal dari data disamping **m1=(1,1)**, **m2=(2,1)**
3. **Tempatkan tiap objek ke kluster terdekat** berdasarkan nilai centroid yang paling dekat selisihnya (jaraknya). Didapatkan hasil, anggota *cluster1* = {A,E,G}, *cluster2*= {B,C,D,F,H}

Nilai SSE yaitu:

$$SSE = \sum_{i=1}^k \sum_{p \in C_i} d(p, m_i)^2$$

$$2^2 + 2,24^2 + 2,83^2 + 3,61^2 + 1^2 + 2,24^2 + 0^2 + 0^2 = 36$$

Interaksi 2

Point	Distance from m_1	Distance from m_2	Cluster Membership
<i>a</i>	2.00	2.24	C_1
<i>b</i>	2.83	2.24	C_2
<i>c</i>	3.61	2.83	C_2
<i>d</i>	4.47	3.61	C_2
<i>e</i>	1.00	1.41	C_1
<i>f</i>	3.16	2.24	C_2
<i>g</i>	0.00	1.00	C_1
<i>h</i>	1.00	0.00	C_2

4. Menghitung **nilai centroid yang baru**

$$m_1 = [(1+1+1)/3, (3+2+1)/3] = (1,2)$$

$$m_2 = [(3+4+5+4+2)/5, (3+3+3+2+1)/5] = (3,6;2,4)$$

5. **Tugaskan lagi setiap objek** dengan memakai pusat klaster yang baru.

Nilai SSE yang baru:

$$SSE = \sum_{i=1}^k \sum_{p \in C_i} d(p, m_i)^2 = 1^2 + 0.85^2 + 0.72^2 + 1.52^2 + 0^2 + 0.57^2 + 1^2 + 1.41^2 = 7.88$$

Iterasi 3

Point	Distance from m_1	Distance from m_2	Cluster Membership
a	1.00	2.67	C_1
b	2.24	0.85	C_2
c	3.16	0.72	C_2
d	4.12	1.52	C_2
e	0.00	2.63	C_1
f	3.00	0.57	C_2
g	1.00	2.95	C_1
h	1.41	2.13	C_2

4. Terdapat perubahan anggota cluster yaitu $\text{cluster1}=\{A,E,G,H\}$, $\text{cluster2}=\{B,C,D,F\}$, maka cari lagi nilai centroid yang baru yaitu: $m_1=(1,25;1,75)$ dan $m_2=(4;2,75)$

5. Tugaskan lagi setiap objek dengan memakai pusat klaster yang baru

Nilai SSE yang baru:

$$\text{SSE} = \sum_{i=1}^k \sum_{p \in C_i} d(p, m_i)^2 = 1.27^2 + 1.03^2 + 0.25^2 + 1.03^2 + 0.35^2 + 0.75^2 + 0.79^2 + 1.06^2 = 6.25$$

Hasil Akhir

Point	Distance from m_1	Distance from m_2	Cluster Membership
<i>a</i>	1.27	3.01	C_1
<i>b</i>	2.15	1.03	C_2
<i>c</i>	3.02	0.25	C_2
<i>d</i>	3.95	1.03	C_2
<i>e</i>	0.35	3.09	C_1
<i>f</i>	2.76	0.75	C_2
<i>g</i>	0.79	3.47	C_1
<i>h</i>	1.06	2.66	C_2

- Dapat dilihat pada tabel. Tidak ada perubahan anggota lagi pada masing-masing cluster
- Hasil akhir yaitu:
cluster1={A,E,G,H}, dan
cluster2={B,C,D,F}
Dengan nilai $SSE = 6,25$ dan jumlah iterasi 3

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses, 2012, **Chapter 6 k-Means Clustering**, pp. 91-103 ([CoronaryHeartDisease.csv](#))
- Gambarkan grafik (chart) dan pilih **Scatter 3D Color** untuk menggambarkan data hasil klastering yang telah dilakukan
- Analisis apa yang telah dilakukan oleh Sonia, dan apa manfaat k-Means clustering bagi pekerjaannya?

Latihan

- Lakukan pengukuran performance dengan menggunakan Cluster Distance Performance, untuk mendapatkan nilai Davies Bouldin Index (DBI)
- Nilai DBI semakin rendah berarti cluster yang kita bentuk semakin baik

Latihan

- Lakukan klastering terhadap data IMFdata.csv
(<http://romisatriawahono.net/lecture/dm/dataset>)

Comments on the *K-Means* Method

- **Strength:**

- *Efficient*: $O(tkn)$, where n is # objects, k is # clusters, and t is # iterations. Normally, $k, t \ll n$.
- Comparing: PAM: $O(k(n-k)^2)$, CLARA: $O(ks^2 + k(n-k))$

- **Comment:** Often terminates at a *local optimal*

- **Weakness**

- Applicable only to **objects in a continuous n-dimensional** space
 - Using the k-modes method for categorical data
 - In comparison, k-medoids can be applied to a wide range of data
- **Need to specify k** , the *number* of clusters, in advance (there are ways to automatically determine the best k (see Hastie et al., 2009))
- **Sensitive to noisy data** and *outliers*
- Not suitable to discover clusters with *non-convex shapes*

Variations of the *K-Means* Method

- Most of the variants of the *k-means* which differ in

- Selection of the **initial *k* means**
- Dissimilarity calculations
- Strategies to calculate cluster means

- Handling categorical data: *k-modes*
 - Replacing means of clusters with modes
 - Using new dissimilarity measures to deal with categorical objects
 - Using a frequency-based method to update modes of clusters
- A mixture of categorical and numerical data: *k-prototype* method

What Is the Problem of the K-Means Method?

- The k-means algorithm is **sensitive to outliers**!
 - Since an object with an extremely large value may substantially distort the distribution of the data
- K-Medoids:
 - Instead of taking the **mean** value of the object in a cluster as a reference point, **medoids** can be used, which is the **most centrally located** object in a cluster

PAM: A Typical K-Medoids Algorithm

Total Cost = 20

Total Cost = 26

The K-Medoid Clustering Method

- K-Medoids Clustering: Find representative objects (medoids) in clusters
- PAM (Partitioning Around Medoids, Kaufmann & Rousseeuw 1987)
 - Starts from an initial set of medoids and iteratively replaces one of the medoids by one of the non-medoids if it improves the total distance of the resulting clustering
 - PAM works effectively for small data sets, but does not scale well for large data sets (due to the computational complexity)
- Efficiency improvement on PAM
 - CLARA (Kaufmann & Rousseeuw, 1990): PAM on samples
 - CLARANS (Ng & Han, 1994): Randomized re-sampling

4.2.2 Hierarchical Methods

Hierarchical Clustering

- Use distance matrix as clustering criteria
- This method does not require the number of clusters k as an input, but needs a termination condition

AGNES (Agglomerative Nesting)

- Introduced in Kaufmann and Rousseeuw (1990)
- Implemented in statistical packages, e.g., Splus
- Use the single-link method and the dissimilarity matrix
- Merge nodes that have the least dissimilarity
- Go on in a non-descending fashion
- Eventually all nodes belong to the same cluster

Dendrogram: Shows How Clusters are Merged

DIANA (Divisive Analysis)

- Introduced in Kaufmann and Rousseeuw (1990)
- Implemented in statistical analysis packages, e.g., Splus
- Inverse order of AGNES
- Eventually each node forms a cluster on its own

Distance between Clusters

- **Single link**: smallest distance between an element in one cluster and an element in the other, i.e., $\text{dist}(K_i, K_j) = \min(t_{ip}, t_{jq})$
- **Complete link**: largest distance between an element in one cluster and an element in the other, i.e., $\text{dist}(K_i, K_j) = \max(t_{ip}, t_{jq})$
- **Average**: avg distance between an element in one cluster and an element in the other, i.e., $\text{dist}(K_i, K_j) = \text{avg}(t_{ip}, t_{jq})$
- **Centroid**: distance between the centroids of two clusters, i.e., $\text{dist}(K_i, K_j) = \text{dist}(C_i, C_j)$
- **Medoid**: distance between the medoids of two clusters, i.e., $\text{dist}(K_i, K_j) = \text{dist}(M_i, M_j)$
 - Medoid: a chosen, centrally located object in the cluster

Centroid, Radius and Diameter of a Cluster (for numerical data sets)

- Centroid: the “middle” of a cluster

$$C_m = \frac{\sum_{i=1}^N (t_{ip})}{N}$$

- Radius: square root of average distance from any point of the cluster to its centroid

$$R_m = \sqrt{\frac{\sum_{i=1}^N (t_{ip} - c_m)^2}{N}}$$

- Diameter: square root of average mean squared distance between all pairs of points in the cluster

$$D_m = \sqrt{\frac{\sum_{i=1}^N \sum_{i=1}^N (t_{ip} - t_{iq})^2}{N(N-1)}}$$

4.2.3 Density-Based Methods

Density-Based Clustering Methods

- Clustering based on density (local cluster criterion), such as density-connected points
- Major features:
 - Discover clusters of arbitrary shape
 - Handle noise
 - One scan
 - Need density parameters as termination condition
- Several interesting studies:
 - DBSCAN: Ester, et al. (KDD'96)
 - OPTICS: Ankerst, et al (SIGMOD'99).
 - DENCLUE: Hinneburg & D. Keim (KDD'98)
 - CLIQUE: Agrawal, et al. (SIGMOD'98) (more grid-based)

Density-Based Clustering: Basic Concepts

- Two parameters:
 - *Eps*: Maximum radius of the neighbourhood
 - *MinPts*: Minimum number of points in an *Eps*-neighbourhood of that point
- $N_{Eps}(q)$: $\{p \text{ belongs to } D \mid \text{dist}(p,q) \leq Eps\}$
- **Directly density-reachable**: A point p is directly density-reachable from a point q w.r.t. *Eps*, *MinPts* if
 - p belongs to $N_{Eps}(q)$
 - core point condition:

$$|N_{Eps}(q)| \geq MinPts$$

MinPts = 5

Eps = 1 cm

Density-Reachable and Density-Connected

- Density-reachable:
 - A point p is **density-reachable** from a point q w.r.t. Eps , $MinPts$ if there is a chain of points $p_1, \dots, p_n$, $p_1 = q$, $p_n = p$ such that p_{i+1} is directly density-reachable from p_i
- Density-connected
 - A point p is **density-connected** to a point q w.r.t. Eps , $MinPts$ if there is a point o such that both, p and q are density-reachable from o w.r.t. Eps and $MinPts$

DBSCAN: Density-Based Spatial Clustering of Applications with Noise

- Relies on a density-based notion of cluster: A cluster is defined as a maximal set of density-connected points
- Discovers clusters of arbitrary shape in spatial databases with noise

DBSCAN: The Algorithm

1. Arbitrary select a point p
2. Retrieve all points density-reachable from p w.r.t. Eps and $MinPts$
3. If p is a core point, a cluster is formed
4. If p is a border point, no points are density-reachable from p and DBSCAN visits the next point of the database
5. Continue the process until all of the points have been processed

If a spatial index is used, the computational complexity of DBSCAN is $O(n \log n)$, where n is the number of database objects. Otherwise, the complexity is $O(n^2)$

DBSCAN: Sensitive to Parameters

Figure 8. DBScan results for DS1 with MinPts at 4 and Eps at (a) 0.5 and (b) 0.4.

<http://webdocs.cs.ualberta.ca/~yaling/Cluster/Applet/Code/Cluster.html>

OPTICS: A Cluster-Ordering Method (1999)

- OPTICS: Ordering Points To Identify the Clustering Structure
 - Ankerst, Breunig, Kriegel, and Sander (SIGMOD'99)
 - Produces a special order of the database wrt its density-based clustering structure
 - This cluster-ordering contains info equiv to the density-based clusterings corresponding to a broad range of parameter settings
 - Good for both automatic and interactive cluster analysis, including finding intrinsic clustering structure
 - Can be represented graphically or using visualization techniques

OPTICS: Some Extension from DBSCAN

- Index-based: k = # of dimensions, N : # of points
 - Complexity: $O(N \cdot \log N)$
- Core Distance of an object p : the smallest value ϵ such that the ϵ -neighborhood of p has at least MinPts objects

Let $N_\epsilon(p)$: ϵ -neighborhood of p , ϵ is a distance value

$$\text{Core-distance}_{\epsilon, \text{MinPts}}(p) = \begin{cases} \text{Undefined} & \text{if } \text{card}(N_\epsilon(p)) < \text{MinPts} \\ \text{MinPts-distance}(p), & \text{otherwise} \end{cases}$$
- Reachability Distance of object p from core object q is the min radius value that makes p density-reachable from q
$$\text{Reachability-distance}_{\epsilon, \text{MinPts}}(p, q) = \begin{cases} \text{Undefined} & \text{if } q \text{ is not a core object} \\ \max(\text{core-distance}(q), \text{distance}(q, p)), & \text{otherwise} \end{cases}$$

Core Distance & Reachability Distance

Density-Based Clustering: OPTICS & Applications:

<http://www.dbs.informatik.uni-muenchen.de/Forschung/KDD/Clustering/OPTICS/Demo>

4.2.4 Grid-Based Methods

Grid-Based Clustering Method

- Using multi-resolution grid data structure
- Several interesting methods
 - **STING** (a Statistical INformation Grid approach) by Wang, Yang and Muntz (1997)
 - **WaveCluster** by Sheikholeslami, Chatterjee, and Zhang (VLDB'98)
 - A multi-resolution clustering approach using wavelet method
 - **CLIQUE**: Agrawal, et al. (SIGMOD'98)
 - Both grid-based and subspace clustering

STING: A Statistical Information Grid Approach

- Wang, Yang and Muntz (VLDB'97)
- The spatial area is divided into rectangular cells
- There are several levels of cells corresponding to different levels of resolution

The STING Clustering Method

- Each cell at a high level is partitioned into a number of smaller cells in the next lower level
- Statistical info of each cell is calculated and stored beforehand and is used to answer queries
- Parameters of higher level cells can be easily calculated from parameters of lower level cell
 - *count, mean, s, min, max*
 - type of distribution—*normal, uniform, etc.*
- Use a top-down approach to answer spatial data queries
- Start from a pre-selected layer—typically with a small number of cells
- For each cell in the current level compute the confidence interval

STING Algorithm and Its Analysis

- Remove the irrelevant cells from further consideration
- When finish examining the current layer, proceed to the next lower level
- Repeat this process until the bottom layer is reached
- Advantages:
 - Query-independent, easy to parallelize, incremental update
 - $O(K)$, where K is the number of grid cells at the lowest level
- Disadvantages:
 - All the cluster boundaries are either horizontal or vertical, and no diagonal boundary is detected

CLIQUE (Clustering In QUEst)

- Agrawal, Gehrke, Gunopulos, Raghavan (SIGMOD'98)
- Automatically identifying subspaces of a high dimensional data space that allow better clustering than original space
- CLIQUE can be considered as both density-based and grid-based
 - It partitions each dimension into the same number of equal length interval
 - It partitions an m-dimensional data space into non-overlapping rectangular units
 - A unit is dense if the fraction of total data points contained in the unit exceeds the input model parameter
 - A cluster is a maximal set of connected dense units within a subspace

CLIQUE: The Major Steps

1. Partition the data space and find the number of points that lie inside each cell of the partition.
2. Identify the subspaces that contain clusters using the Apriori principle
3. Identify clusters
 1. Determine dense units in all subspaces of interests
 2. Determine connected dense units in all subspaces of interests.
4. Generate minimal description for the clusters
 1. Determine maximal regions that cover a cluster of connected dense units for each cluster
 2. Determination of minimal cover for each cluster

Salary
(10,000)

Vacation(w
eek)

$\tau = 3$

Strength and Weakness of *CLIQUE*

- Strength
 - automatically finds subspaces of the highest dimensionality such that high density clusters exist in those subspaces
 - insensitive to the order of records in input and does not presume some canonical data distribution
 - scales linearly with the size of input and has good scalability as the number of dimensions in the data increases
- Weakness
 - The accuracy of the clustering result may be degraded at the expense of simplicity of the method

4.3 Algoritma Asosiasi

4.3.1 Frequent Itemset Mining Methods

4.3.2 Pattern Evaluation Methods

What Is Frequent Pattern Analysis?

- **Frequent pattern**: a pattern (a set of items, subsequences, substructures, etc.) that occurs frequently in a data set
- **First proposed by Agrawal**, Imielinski, and Swami [AIS93] in the context of frequent itemsets and association rule mining
- **Motivation**: Finding inherent regularities in data
 - What products were often purchased together?— Beer and diapers?!
 - What are the subsequent purchases after buying a PC?
 - What kinds of DNA are sensitive to this new drug?
 - Can we automatically classify web documents?
- **Applications**
 - Basket data analysis, cross-marketing, catalog design, sale campaign analysis, Web log (click stream) analysis, and DNA sequence analysis.

Why Is Freq. Pattern Mining Important?

- **Freq. pattern**: An intrinsic and important property of datasets
- Foundation for many essential data mining tasks
 - Association, correlation, and causality analysis
 - Sequential, structural (e.g., sub-graph) patterns
 - Pattern analysis in spatiotemporal, multimedia, time-series, and stream data
 - Classification: discriminative, frequent pattern analysis
 - Cluster analysis: frequent pattern-based clustering
 - Data warehousing: iceberg cube and cube-gradient
 - Semantic data compression: fascicles
 - Broad applications

Basic Concepts: Frequent Patterns

Tid	Items bought
10	Beer, Nuts, Diaper
20	Beer, Coffee, Diaper
30	Beer, Diaper, Eggs
40	Nuts, Eggs, Milk
50	Nuts, Coffee, Diaper, Eggs, Milk

- **itemset**: A set of one or more items
- **k-itemset** $X = \{x_1, \dots, x_k\}$
- **(absolute) support**, or, **support count** of X : Frequency or occurrence of an itemset X
- **(relative) support**, s , is the fraction of transactions that contains X (i.e., the probability that a transaction contains X)
- An itemset X is **frequent** if X 's support is no less than a *minsup* threshold

Basic Concepts: Association Rules

Tid	Items bought
10	Beer, Nuts, Diaper
20	Beer, Coffee, Diaper
30	Beer, Diaper, Eggs
40	Nuts, Eggs, Milk
50	Nuts, Coffee, Diaper, Eggs, Milk

- Find all the rules $X \rightarrow Y$ with minimum support and confidence
 - support**, s , probability that a transaction contains $X \cup Y$
 - confidence**, c , conditional probability that a transaction having X also contains Y

Let $\text{minsup} = 50\%$, $\text{minconf} = 50\%$

Freq. Pat.: Beer:3, Nuts:3, Diaper:4, Eggs:3, {Beer, Diaper}:3

- Association rules: (many more!)
 - $\text{Beer} \rightarrow \text{Diaper}$ (60%, 100%)
 - $\text{Diaper} \rightarrow \text{Beer}$ (60%, 75%)

Closed Patterns and Max-Patterns

- A long pattern contains a combinatorial number of sub-patterns, e.g., $\{a_1, \dots, a_{100}\}$ contains $\binom{100}{1} + \binom{100}{2} + \dots + \binom{100}{100} = 2^{100} - 1 = 1.27 \cdot 10^{30}$ sub-patterns!
- Solution: Mine *closed patterns* and *max-patterns* instead
- An itemset X is **closed** if X is *frequent* and there exists *no super-pattern* $Y \supset X$, with the same support as X (proposed by Pasquier, et al. @ ICDT'99)
- An itemset X is a **max-pattern** if X is frequent and there exists no frequent super-pattern $Y \supset X$ (proposed by Bayardo @ SIGMOD'98)
- Closed pattern is a lossless compression of freq. patterns
 - Reducing the # of patterns and rules

Closed Patterns and Max-Patterns

- Exercise. $DB = \{ \langle a_1, \dots, a_{100} \rangle, \langle a_1, \dots, a_{50} \rangle \}$
 - $Min\_sup = 1$.
- What is the set of **closed itemset**?
 - $\langle a_1, \dots, a_{100} \rangle: 1$
 - $\langle a_1, \dots, a_{50} \rangle: 2$
- What is the set of **max-pattern**?
 - $\langle a_1, \dots, a_{100} \rangle: 1$
- What is the set of **all patterns**?
 - !!

Computational Complexity of Frequent Itemset Mining

- How many itemsets are potentially to be generated in the worst case?
 - The number of frequent itemsets to be generated is sensitive to the minsup threshold
 - When minsup is low, there exist potentially an exponential number of frequent itemsets
 - The worst case: MN where M : # distinct items, and N : max length of transactions
- The worst case complexity vs. the expected probability
Ex. Suppose Walmart has 104 kinds of products
 - The chance to pick up one product 10^{-4}
 - The chance to pick up a particular set of 10 products: $\sim 10^{-40}$
 - What is the chance this particular set of 10 products to be frequent 103 times in 109 transactions?

4.3.1 Frequent Itemset Mining Methods

Scalable Frequent Itemset Mining Methods

- **Apriori**: A Candidate Generation-and-Test Approach
- Improving the Efficiency of Apriori
- **FPGrowth**: A Frequent Pattern-Growth Approach
- **ECLAT**: Frequent Pattern Mining with Vertical Data Format

The Downward Closure Property and Scalable Mining Methods

- The downward closure property of frequent patterns
 - Any subset of a frequent itemset must be frequent
 - If {beer, diaper, nuts} is frequent, so is {beer, diaper}
 - i.e., every transaction having {beer, diaper, nuts} also contains {beer, diaper}
- Scalable mining methods: **Three major approaches**
 - Apriori (Agrawal & Srikant@VLDB'94)
 - Freq. pattern growth (FPgrowth—Han, Pei & Yin @SIGMOD'00)
 - Vertical data format approach (Charm—Zaki & Hsiao @SDM'02)

Apriori: A Candidate Generation & Test Approach

- **Apriori pruning principle:** If there is any itemset which is infrequent, its superset should not be generated/tested! (Agrawal & Srikant @VLDB'94, Mannila, et al. @ KDD' 94)
- **Method:**
 1. Initially, scan DB once to get frequent 1-itemset
 2. Generate length $(k+1)$ candidate itemsets from length k frequent itemsets
 3. Test the candidates against DB
 4. Terminate when no frequent or candidate set can be generated

The Apriori Algorithm—An Example

The Apriori Algorithm (Pseudo-Code)

C_k : Candidate itemset of size k

L_k : frequent itemset of size k

$L_1 = \{\text{frequent items}\};$

for ($k = 1; L_k \neq \emptyset; k++$) **do begin**

C_{k+1} = candidates generated from L_k ;

for each transaction t in database **do**

increment the count of all candidates in C_{k+1} that are
contained in t

L_{k+1} = candidates in C_{k+1} with min_support

end

return $\cup_k L_k$;

Implementation of Apriori

- How to generate candidates?
 - Step 1: self-joining L_k
 - Step 2: pruning
- Example of Candidate-generation
 - $L_3 = \{abc, abd, acd, ace, bcd\}$
 - Self-joining: $L_3 * L_3$
 - $abcd$ from abc and abd
 - $acde$ from acd and ace
 - Pruning:
 - $acde$ is removed because ade is not in L_3
 - $C_4 = \{abcd\}$

How to Count Supports of Candidates?

- Why counting supports of candidates a problem?
 - The total number of candidates can be very huge
 - One transaction may contain many candidates
- Method:
 - Candidate itemsets are stored in a *hash-tree*
 - *Leaf node* of hash-tree contains a list of itemsets and counts
 - *Interior node* contains a hash table
 - *Subset function*: finds all the candidates contained in a transaction

Counting Supports of Candidates Using Hash Tree

Candidate Generation: An SQL Implementation

- SQL Implementation of candidate generation

- Suppose the items in L_{k-1} are listed in an order

- Step 1: self-joining L_{k-1}

insert into C_k

select **$p.item_1, p.item_2, \dots, p.item_{k-1}, q.item_{k-1}$**

from L_{k-1} **p, L_{k-1} q**

where **$p.item_1=q.item_1, \dots, p.item_{k-2}=q.item_{k-2}, p.item_{k-1} < q.item_{k-1}$**

- Step 2: pruning

forall ***itemsets* c in C_k** do

forall ***(k-1)-subsets* s of c** do

if (s is not in L_{k-1}) then delete c from C_k

- Use object-relational extensions like UDFs, BLOBs, and Table functions for efficient implementation

(S. Sarawagi, S. Thomas, and R. Agrawal. Integrating association rule mining with relational database systems: Alternatives and implications. SIGMOD'98)

Pattern-Growth Approach: Mining Frequent Patterns Without Candidate Generation

- **Bottlenecks of the Apriori** approach
 - Breadth-first (i.e., level-wise) search
 - Candidate generation and test
 - Often generates a huge number of candidates
- The **FPGrowth** Approach (*J. Han, J. Pei, and Y. Yin, SIGMOD' 00*)
 - Depth-first search
 - Avoid explicit candidate generation
- **Major philosophy**: Grow long patterns from short ones using local frequent items only
 - “abc” is a frequent pattern
 - Get all transactions having “abc”, i.e., project DB on abc: DB|abc
 - “d” is a local frequent item in DB|abc → abcd is a frequent pattern

Construct FP-tree from a Transaction Database

<i>TID</i>	<i>Items bought</i>	<i>(ordered) frequent items</i>
100	{f, a, c, d, g, i, m, p}	{f, c, a, m, p}
200	{a, b, c, f, l, m, o}	{f, c, a, b, m}
300	{b, f, h, j, o, w}	{f, b}
400	{b, c, k, s, p}	{c, b, p}
500	{a, f, c, e, l, p, m, n}	{f, c, a, m, p}

min_support = 3

1. Scan DB once, find frequent 1-itemset (single item pattern)
2. Sort frequent items in frequency descending order, f-list
3. Scan DB again, construct FP-tree

Header Table

Item frequency head

<i>f</i>	4
<i>c</i>	4
<i>a</i>	3
<i>b</i>	3
<i>m</i>	3
<i>p</i>	3

F-list = f-c-a-b-m-p

Partition Patterns and Databases

- Frequent patterns can be partitioned into subsets according to f-list
 - F-list = f-c-a-b-m-p
 - Patterns containing p
 - Patterns having m but no p
 - ...
 - Patterns having c but no a nor b, m, p
 - Pattern f
- Completeness and non-redundancy

Find Patterns Having P From P-conditional Database

- Starting at the frequent item header table in the FP-tree
- Traverse the FP-tree by following the link of each frequent item p
- Accumulate all of *transformed prefix paths* of item p to form p 's conditional pattern base

Conditional pattern bases

item *cond. pattern base*

c *f:3*

a *fc:3*

b *fca:1, f:1, c:1*

m *fca:2, fcab:1*

p *fcam:2, cb:1*

From Conditional Pattern-bases to Conditional FP-trees

- For each pattern-base
 - Accumulate the count for each item in the base
 - Construct the FP-tree for the frequent items of the pattern base

m-conditional pattern base:
fca:2, fcab:1

{
 |
f:3
 |
c:3
 |
a:3

All frequent patterns
 relate to *m*
m,
fm, cm, am,
fcm, fam, cam,
fcam

m-conditional FP-tree

Recursion: Mining Each Conditional FP-tree

A Special Case: Single Prefix Path in FP-tree

- Suppose a (conditional) FP-tree T has a shared single prefix-path P
- Mining can be decomposed into two parts
 - Reduction of the single prefix path into one node
 - Concatenation of the mining results of the two parts

Benefits of the FP-tree Structure

- **Completeness**

- Preserve complete information for frequent pattern mining
- Never break a long pattern of any transaction

- **Compactness**

- Reduce irrelevant info—infrequent items are gone
- Items in frequency descending order: the more frequently occurring, the more likely to be shared
- Never be larger than the original database (not count node-links and the *count* field)

The Frequent Pattern Growth Mining Method

- Idea: **Frequent pattern growth**
 - Recursively grow frequent patterns by pattern and database partition
- **Method**
 1. For each frequent item, construct its conditional pattern-base, and then its conditional FP-tree
 2. Repeat the process on each newly created conditional FP-tree
 3. Until the resulting FP-tree is empty, or it contains only one path—single path will generate all the combinations of its sub-paths, each of which is a frequent pattern

Scaling FP-growth by Database Projection

- What about if FP-tree cannot fit in memory? **DB projection**
- First partition a database into a set of projected DBs
- Then construct and mine FP-tree for each projected DB
- **Parallel projection** vs. **partition projection** techniques
 - **Parallel projection**
 - Project the DB in parallel for each frequent item
 - Parallel projection is space costly
 - All the partitions can be processed in parallel
 - **Partition projection**
 - Partition the DB based on the ordered frequent items
 - Passing the unprocessed parts to the subsequent partitions

Partition-Based Projection

- **Parallel projection** needs a lot of disk space
- **Partition projection** saves it

FP-Growth vs. Apriori: Scalability With the Support Threshold

FP-Growth vs. Tree-Projection: Scalability with the Support Threshold

Advantages of the Pattern Growth Approach

- **Divide-and-conquer:**
 - Decompose both the mining task and DB according to the frequent patterns obtained so far
 - Lead to focused search of smaller databases
- Other factors
 - No candidate generation, no candidate test
 - Compressed database: FP-tree structure
 - No repeated scan of entire database
 - Basic ops: counting local freq items and building sub FP-tree, no pattern search and matching
- A good open-source implementation and refinement of FPGrowth
 - FPGrowth+ (Grahne and J. Zhu, FIMI'03)

Further Improvements of Mining Methods

- **AFOPT** (*Liu, et al. @ KDD'03*)
 - A “push-right” method for mining condensed frequent pattern (CFP) tree
- **Carpenter** (*Pan, et al. @ KDD'03*)
 - Mine data sets with small rows but numerous columns
 - Construct a row-enumeration tree for efficient mining
- **FPgrowth+** (*Grahne and Zhu, FIMI'03*)
 - Efficiently Using Prefix-Trees in Mining Frequent Itemsets, Proc. ICDM'03 Int. Workshop on Frequent Itemset Mining Implementations (FIMI'03), Melbourne, FL, Nov. 2003
- **TD-Close** (*Liu, et al, SDM'06*)

Extension of Pattern Growth Mining Methodology

- Mining closed frequent itemsets and max-patterns
 - CLOSET (DMKD'00), FPclose, and FPMax (Grahne & Zhu, Fimi'03)
- Mining sequential patterns
 - PrefixSpan (ICDE'01), CloSpan (SDM'03), BIDE (ICDE'04)
- Mining graph patterns
 - gSpan (ICDM'02), CloseGraph (KDD'03)
- Constraint-based mining of frequent patterns
 - Convertible constraints (ICDE'01), gPrune (PAKDD'03)
- Computing iceberg data cubes with complex measures
 - H-tree, H-cubing, and Star-cubing (SIGMOD'01, VLDB'03)
- Pattern-growth-based Clustering
 - MaPle (Pei, et al., ICDM'03)
- Pattern-Growth-Based Classification
 - Mining frequent and discriminative patterns (Cheng, et al, ICDE'07)

4.3.2 Pattern Evaluation Methods

Interestingness Measure: Correlations (Lift)

- *play basketball* $\Rightarrow$ *eat cereal* [40%, 66.7%] is misleading
 - The overall % of students eating cereal is 75% > 66.7%.
- *play basketball* $\Rightarrow$ *not eat cereal* [20%, 33.3%] is more accurate, although with lower support and confidence
- Measure of dependent/correlated events: [lift](#)

$$lift = \frac{P(A \cup B)}{P(A)P(B)}$$

$$lift(B, C) = \frac{2000/5000}{3000/5000 * 3750/5000} = 0.89$$

$$lift(B, \neg C) = \frac{1000/5000}{3000/5000 * 1250/5000} = 1.33$$

	Basketball	Not basketball	Sum (row)
Cereal	2000	1750	3750
Not cereal	1000	250	1250
Sum(col.)	3000	2000	5000

Are *lift* and χ^2 Good Measures of Correlation?

- “Buy walnuts $\Rightarrow$ buy milk [1%, 80%]” is misleading if 85% of customers buy milk
- Support and confidence are not good to indicate correlations
- Over 20 interestingness measures have been proposed (see Tan, Kumar, Sritastava @KDD’02)
- Which are good ones?

symbol	measure	range	formula
ϕ	ϕ -coefficient	-1 ... 1	$\frac{P(A,B) - P(A)P(B)}{\sqrt{P(A)P(B)(1-P(A))(1-P(B))}}$

where: P1: $O(M) = 0$ if $\det(M) = 0$, i.e., whenever A and B are statistically independent.

P2: $O(M_2) > O(M_1)$ if $M_2 = M_1 + [k \ -k; \ -k \ k]$.

P3: $O(M_2) < O(M_1)$ if $M_2 = M_1 + [0 \ k; \ 0 \ -k]$ or $M_2 = M_1 + [0 \ 0; \ k \ -k]$.

O1: Property 1: Symmetry under variable permutation.

O2: Property 2: Row and Column scaling invariance.

O3: Property 3: Antisymmetry under row or column permutation.

O3': Property 4: Inversion invariance.

O4: Property 5: Null invariance.

Yes*: Yes if measure is normalized.

No*: Symmetry under row or column permutation.

No**: No unless the measure is symmetrized by taking $\max(M(A, B), M(B, A))$.

Comparison of Interestingness Measures

- Null-(transaction) invariance is crucial for correlation analysis
- Lift and χ^2 are not null-invariant
- 5 null-invariant measures

	Milk	No Milk	Sum (row)
Coffee	m, c	~m, c	c
No Coffee	m, ~c	~m, ~c	~c
Sum(col.)	m	~m	Σ

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses 2nd Edition, 2016, **Chapter 5 (Association Rules)**, p 85-97
- Analisis, bagaimana data mining bisa bermanfaat untuk membantu Roger, seorang City Manager

1. Business Understanding

- **Motivation:**

- Roger is a city manager for a medium-sized, but steadily growing city
- The city has limited resources, and like most municipalities, there are more needs than there are resources
- He feels like the **citizens in the community are fairly active in various community organizations**, and believes that he may be able to get a number of groups to work together to meet some of the needs in the community
- He knows there are churches, social clubs, hobby enthusiasts and other types of groups in the community
- What he doesn't know is if there are **connections between the groups** that might enable natural collaborations between two or more groups that could work together on projects around town

- **Objectives:**

- To find out if there are **any existing associations** between the different types of groups in the area

4.4 Algoritma Estimasi dan Forecasting

4.4.1 Linear Regression

4.4.2 Time Series Forecasting

4.4.1 Linear Regression

Tahapan Algoritma Linear Regression

1. Siapkan data
2. Identifikasi Atribut dan Label
3. Hitung X^2 , Y^2 , XY dan total dari masing-masingnya
4. Hitung a dan b berdasarkan persamaan yang sudah ditentukan
5. Buat Model Persamaan Regresi Linear Sederhana

1. Persiapan Data

Tanggal	Rata-rata Suhu Ruangan (X)	Jumlah Cacat (Y)
1	24	10
2	22	5
3	21	6
4	20	3
5	22	6
6	19	4
7	20	5
8	23	9
9	24	11
10	25	13

2. Identifikasikan Atribut dan Label

$$Y = a + bX$$

Dimana:

Y = Variabel terikat (Dependen)

X = Variabel tidak terikat (Independen)

a = konstanta

b = koefisien regresi (kemiringan); besaran Response yang ditimbulkan oleh variabel

$$a = \frac{(\sum y) (\sum x^2) - (\sum x) (\sum xy)}{n(\sum x^2) - (\sum x)^2}$$

$$b = \frac{n(\sum xy) - (\sum x) (\sum y)}{n(\sum x^2) - (\sum x)^2}$$

3. Hitung X^2 , Y^2 , XY dan total dari masing-masingnya

Tanggal	Rata-rata Suhu Ruangan (X)	Jumlah Cacat (Y)	X^2	Y^2	XY
1	24	10	576	100	240
2	22	5	484	25	110
3	21	6	441	36	126
4	20	3	400	9	60
5	22	6	484	36	132
6	19	4	361	16	76
7	20	5	400	25	100
8	23	9	529	81	207
9	24	11	576	121	264
10	25	13	625	169	325
220		72	4876	618	1640

4. Hitung a dan b berdasarkan persamaan yang sudah ditentukan

- Menghitung Koefisien Regresi (a)

$$a = \frac{(\sum y)(\sum x^2) - (\sum x)(\sum xy)}{n(\sum x^2) - (\sum x)^2}$$

$$a = \frac{(72)(4876) - (220)(1640)}{10(4876) - (220)^2}$$

$$\mathbf{a = -27,02}$$

- Menghitung Koefisien Regresi (b)

$$b = \frac{n(\sum xy) - (\sum x)(\sum y)}{n(\sum x^2) - (\sum x)^2}$$

$$b = \frac{10(1640) - (220)(72)}{10(4876) - (220)^2}$$

$$\mathbf{b = 1,56}$$

5. Buat Model Persamaan Regresi Linear Sederhana

$$Y = a + bX$$

$$Y = -27,02 + 1,56X$$

Pengujian

1. Prediksikan Jumlah Cacat Produksi jika suhu dalam keadaan tinggi (Variabel X), contohnya: 30°C

$$Y = -27,02 + 1,56X$$

$$Y = -27,02 + 1,56(30) \\ = 19,78$$

2. Jika Cacat Produksi (Variabel Y) yang ditargetkan hanya boleh 5 unit, maka berapakah suhu ruangan yang diperlukan untuk mencapai target tersebut?

$$5 = -27,02 + 1,56X$$

$$1,56X = 5 + 27,02$$

$$X = 32,02 / 1,56$$

$$\mathbf{X = 20,52}$$

Jadi **Prediksi Suhu Ruangan** yang paling sesuai untuk mencapai target Cacat Produksi adalah sekitar **20,52°C**

7.1.2 Studi Kasus CRISP-DM

Heating Oil Consumption – Estimation

(Matthew North, *Data Mining for the Masses*, 2012,
Chapter 8 Estimation, pp. 127-140)

Dataset: [HeatingOil-Training.csv](#) dan [HeatingOil-Scoring.csv](#)

Latihan

- Lakukan eksperimen mengikuti buku Matthew North, Data Mining for the Masses, 2012, Chapter 8 Estimation, pp. 127-140 tentang Heating Oil Consumption
- Dataset: HeatingOil-Training.csv dan HeatingOil-Scoring.csv

CRISP-DM

Context and Perspective

- Sarah, the regional sales manager is back for more help
- **Business is booming**, her sales team is signing up thousands of new clients, and she wants to be sure the company will be able to meet this new level of demand, she now is hoping we can help her **do some prediction as well**
- She knows that there is some correlation between the attributes in her data set (things like temperature, insulation, and occupant ages), and she's now wondering if she can use the previous data set **to predict heating oil usage for new customers**
- You see, these new customers haven't begun consuming heating oil yet, there are a lot of them (42,650 to be exact), and she wants to know **how much oil she needs to expect to keep in stock** in order to meet these new customers' demand
- Can she use data mining to examine household attributes and known past consumption quantities to anticipate and meet her new customers' needs?

1. Business Understanding

- Sarah's new data mining objective is pretty clear: **she wants to anticipate demand for a consumable product**
- We will use a linear regression model to help her with her desired predictions
- She has data, **1,218 observations** that give an attribute profile for each home, along with those homes' annual heating oil consumption
- She wants to use this data set as training data to predict the usage that **42,650 new clients will bring to her company**
- She knows that these new clients' homes are similar in nature to her existing client base, so the existing customers' usage behavior should serve as a solid gauge for predicting future usage by new customers.

2. Data Understanding

We create a data set comprised of the following attributes:

- **Insulation**: This is a density rating, ranging from one to ten, indicating the **thickness of each home's insulation**. A home with a density rating of one is poorly insulated, while a home with a density of ten has excellent insulation
- **Temperature**: This is the average **outdoor ambient temperature** at each home for the most recent year, measure in degree Fahrenheit
- **Heating_Oil**: This is the **total number of units of heating oil** purchased by the owner of each home in the most recent year
- **Num_Occupants**: This is the total **number of occupants living** in each home
- **Avg_Age**: This is the average age of those occupants
- **Home_Size**: This is a rating, on a scale of one to eight, of the home's overall size. The higher the number, the larger the home

3. Data Preparation

- A CSV data set for this chapter's example is available for download at the book's companion web site (<https://sites.google.com/site/dataminingforthemasses/>)

3. Data Preparation

Figure 8-2. Value ranges for the training data set's attributes.

Figure 8-3. Value ranges for the scoring data set's attributes.

3. Data Preparation

The screenshot displays the RapidMiner software interface for data preparation. The main workspace shows a workflow diagram with the following components:

- Training (CH4)**: A process operator that outputs to the **Set Role** operator.
- Set Role**: A process operator that receives input from the **Training (CH4)** operator and outputs to the **Scoring (CH4)** operator.
- Scoring (CH4)**: A process operator that outputs to the first **Filter Examples** operator.
- Filter Examples**: Two operators that filter the data based on specific criteria.

The right sidebar shows the **Parameters** for the **Set Role** operator:

- name**: Heating_Oil
- target role**: label
- set additional roles**: Edit List (0)...

The bottom status bar displays a warning message:

Message	Fixes	Location

4.4.2 Time Series Forecasting

Time Series Forecasting

- Time series forecasting is one of the **oldest known predictive analytics** techniques
 - It has existed and been in **widespread use even before** the term “predictive analytics” was ever coined
- Independent or predictor variables are **not strictly necessary for univariate time series forecasting**, but are strongly recommended for multivariate time series
- **Time series forecasting** methods:
 1. **Data Driven Method**: There is **no difference between a predictor and a target**. Techniques such as time series averaging or smoothing are considered data-driven approaches to time series forecasting
 2. **Model Driven Method**: Similar to “conventional” predictive models, which have **independent and dependent variables**, but with a twist: **the independent variable is now time**

Data Driven Methods

- There is **no difference between a predictor and a target**
- The predictor is also the target variable
- Data Driven Methods:
 - Naïve Forecast
 - Simple Average
 - Moving Average
 - Weighted Moving Average
 - Exponential Smoothing
 - Holt's Two-Parameter Exponential Smoothing

Model Driven Methods

- In model-driven methods, **time is the predictor** or independent variable and **the time series value is the dependent variable**
- Model-based methods are generally preferable when the time series appears to have a **“global” pattern**
- The idea is that the **model parameters will be able to capture** these patterns
 - Thus enable us to make predictions for any step ahead in the future under the assumption that this **pattern is going to repeat**
- For a time series with local patterns instead of a global pattern, using the model-driven approach requires specifying how and when the patterns change, which is difficult

Model Driven Methods

- Linear Regression
- Polynomial Regression
- Linear Regression with Seasonality
- Autoregression Models and **ARIMA**

How to Implement

- RapidMiner's approach to time series is based on **two main data transformation** processes
- The first is **windowing** to transform the time series data into a generic data set:
 - This step will convert the **last row** of a window within the time series into a **label** or target variable
- We apply any of the “learners” or algorithms to **predict the target variable** and thus predict the next time step in the series

Windowing Concept

- The parameters of the **Windowing** operator allow changing the **size of the windows**, the overlap between consecutive windows (**step size**), and the prediction **horizon**, which is used for forecasting
- The prediction **horizon** controls which row in the raw data series ends up as the label variable in the transformed series

Apr 1, 2010	-0.077	-0.040	1.381	0.761	2.312	1.795	0.586
May 1, 2010	0.613	1.381	0.761	2.312	1.795	0.586	-0.077

Window size = 6
Step size = 1
Horizon = 1

Using data from 6 rows (Jan 2009 – Jun 2009) of the window, a learner can be trained to predict the label which is the value of the time series in the next time step (Jul 2009) and so on.

Windowing Operator Parameters

- **Window size**: Determines how many “attributes” are created for the cross-sectional data
 - Each row of the original time series within the window width will become a new attribute
 - We choose $w = 6$
- **Step size**: Determines how to advance the window
 - Let us use $s = 1$
- **Horizon**: Determines how far out to make the forecast
 - If the window size is 6 and the horizon is 1, then the seventh row of the original time series becomes the first sample for the “label” variable
 - Let us use $h = 1$

Latihan

- Lakukan training dengan menggunakan **linear regression** pada dataset **hargasaham-training-uni.xls**
- Gunakan Split Data untuk memisahkan dataset di atas, 90% training dan 10% untuk testing
- Harus dilakukan proses **Windowing** pada dataset
- **Plot grafik** antara label dan hasil prediksi dengan menggunakan chart

vvvvv

Latihan

- Lakukan training dengan menggunakan **linear regression** pada dataset **hargasaham-training.xls**
- Terapkan model yang dihasilkan untuk data **hargasaham-testing-kosong.xls**
- Harus dilakukan proses **Windowing** pada dataset
- **Plot grafik** antara label dan hasil prediksi dengan menggunakan chart

5. Text Mining

5.1 Text Mining Concepts

5.2 Text Clustering

5.3 Text Classification

5.4 Data Mining Law

5.1 Text Mining Concepts

Data Mining vs Text Mining

1. Text Mining:

- Mengolah **data tidak terstruktur** dalam bentuk text, web, social media, dsb
- Menggunakan **metode text processing** untuk mengkonversi data tidak terstruktur menjadi terstruktur
 - Kemudian **diolah dengan data mining**

2. Data Mining:

- Mengolah **data terstruktur** dalam bentuk tabel yang memiliki atribut dan kelas
- Menggunakan **metode data mining**, yang terbagi menjadi metode estimasi, forecasting, klasifikasi, klastering atau asosiasi
 - Yang dasar berpikirnya menggunakan konsep **statistika** atau heuristik ala **machine learning**

How Text Mining Works

- The fundamental step is to **convert text into semi-structured data**
- Then apply the data mining methods to **classify, cluster, and predict**

Text Mining: Jejak Pornografi di Indonesia

Text Mining: AHY-AHOK-ANIES

Proses Data Mining

$$\forall a \in \mathbb{R} \text{ such that } |y - a| \leq \epsilon \Rightarrow (f(x) - f(a))$$

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \frac{b-a}{n} \sum_{k=1}^n f\left(a + \frac{b-a}{n} \cdot k\right)$$

$$-(-m_2 g \tan(\theta)) \Big|_l = \frac{r^2}{4l} + \left(\cos(\omega t) + \frac{r}{4l} \cos(2\omega t) \right)$$

$$+ R_1 g \left(-\zeta + \sqrt{\zeta^2 - 1} \right) \log j + R_2 g \left(-\zeta - \sqrt{\zeta^2 - 1} \right) \log j$$

$$w_p = \left[\int_0^1 dx = \left(\frac{2.27}{0^2} \right) \right] ; z dx = \left(\frac{87}{0^2} \right) \cdot (x_2^2 - 1)$$

Word, Token and Tokenization

Document 1

This is a book on data mining.

Document 2

This book describes data mining and text mining using RapidMiner.

- Words are separated by a special character: a blank space
- Each word is called a token
- The process of discretizing words within a document is called tokenization
- For our purpose here, each sentence can be considered a separate document, although what is considered an individual document may depend upon the context
- For now, a document here is simply a sequential collection of tokens

Matrix of Terms

- We can impose some form of structure on this raw data by creating a **matrix**, where:
 - the columns consist of **all the tokens found** in the two documents
 - the cells of the matrix are the counts of the **number of times a token appears**
- **Each token** is now **an attribute** in standard data mining parlance and each **document is an example**

	this	is	a	book	on	data	mining	describes	text	rapidminer	and	using
<i>Document 1</i>	1	1	1	1	1	1	1	0	0	0	0	0
<i>Document 2</i>	1	0	0	1	0	1	2	1	1	1	1	1

Term Document Matrix (TDM)

- Basically, **unstructured raw data is now transformed into a format that is recognized**, not only by the human users as a data table, but more importantly by all the machine learning algorithms which require such tables for training
- This table is called a **document vector** or **term document matrix (TDM)** and is the cornerstone of the preprocessing required for text mining

	this	is	a	book	on	data	mining	describes	text	rapidminer	and	Using
<i>Docu- ment 1</i>	1/7 = 0.1428	0.1428	0.1428	0.1428	0.1428	0.1428	0.1428	0	0	0	0	0
<i>Docu- ment 2</i>	1/10 = 0.1	0	0	0.1	0	0.1	0.2	0.1	0.1	0.1	0.1	0.1

TF-IDF

- We could have also chosen to use the **TF-IDF** scores for each term to create the **document vector**
- N is the **number of documents** that we are trying to mine
- N_k is the **number of documents that contain the keyword, k**

$$TF = n_k / n$$

$$IDF = \log_2 (N / N_k)$$

$$TF - IDF = n_k / n * \log_2 (N / N_k)$$

ExampleSet (2 examples, 0 special attributes, 12 regular attributes)

Row No.	RapidMiner	This	a	and	book	data	describes	is	mining	on	text	using
1	0	0	0.577	0	0	0	0	0.577	0	0.577	0	0
2	0.447	0	0	0.447	0	0	0.447	0	0	0	0.447	0.447

Stopwords

- In the two sample text documents was the occurrence of common words such as “a,” “this,” “and,” and other similar terms
- Clearly in larger documents we would expect a **larger number** of such terms that **do not really convey specific meaning**
- Most grammatical necessities such as articles, conjunctions, prepositions, and pronouns may **need to be filtered** before we perform additional analysis
 - Such terms are called **stopwords** and usually include most articles, conjunctions, pronouns, and prepositions
 - **Stopword filtering** is usually the second step that follows immediately after tokenization
- Notice that our **document vector has a significantly reduced** size after applying standard English stopwords filtering

Row No.	RapidMiner	book	data	describes	mining	text	using
1	0	1	1	0	1	0	0
2	1	1	1	1	2	1	1

Stopwords Bahasa Indonesia

- Lakukan googling dengan keyword: **stopwords bahasa Indonesia**
- Download stopwords bahasa Indonesia dan gunakan di Rapidminer

Stemming

- Words such as “recognized,” “recognizable,” or “recognition” in different usages, but contextually they may **all imply the same meaning**, for example:
 - “Einstein is a **well-recognized** name in physics”
 - “The physicist went by the easily **recognizable** name of Einstein”
 - “Few other physicists have the kind of name **recognition** that Einstein has”
 - The so-called root of all these highlighted words is “**recognize**”
- By **reducing terms** in a document to their basic stems, we can simplify the conversion of unstructured text to structured data because we now only take into account the occurrence of the root terms
- This process is called **stemming**. The most common stemming technique for text mining in English is the **Porter method** (Porter, 1980)

A Typical Sequence of Preprocessing Steps to Use in Text Mining

Step	Action	Result
1	Tokenize	Convert each word or term in a document into a distinct attribute
2	Stopword removal	Remove highly common grammatical tokens/words
3	Filtering	Remove other very common tokens
4	Stemming	Trim each token to its most essential minimum
5	n-grams	Combine commonly occurring token pairs or tuples (more than 2)

N-Grams

- There are **families of words** in the spoken and written language that typically go together
 - The word “Good” is usually followed by either “Morning,” “Afternoon,” “Evening,” “Night,” or in Australia, “Day”
 - Grouping such terms, called **n-grams**, and analyzing them statistically can present new insights
- Search engines **use word n-gram models for a variety of applications**, such as:
 - Automatic translation, identifying speech patterns, checking misspelling, entity detection, information extraction, among many different use cases

Rapidminer Process of Text Mining

5.2 Text Clustering

Latihan

- Lakukan eksperimen mengikuti buku Matthew North (Data Mining for the Masses) **Chapter 12 (Text Mining)**, 2012, p 189-215
- Datasets: **Federalist Papers**
- Pahami alur text mining yang dilakukan dan sesuaikan dengan konsep yang sudah dipelajari

1. Business Understanding

- Motivation:

- Gillian is a **historian**, and she has recently curated an exhibit on the Federalist Papers, the essays that were written and published in the late 1700's
- The essays were **published anonymously** under the author name 'Publius', and no one really knew at the time if 'Publius' was one individual or many
- After Alexander Hamilton died in 1804, some notes were discovered that revealed that he (**Hamilton**), **James Madison** and **John Jay** had been the authors of the papers
- The notes indicated specific authors for some papers, but **not for others**:
 - John Jay was revealed to be the author for papers **3, 4 and 5**
 - James Madison for paper **14**
 - Hamilton for paper **17**
 - Paper **18 had no author named**, but there was evidence that Hamilton and Madison worked on that one together

- Objective:

- Gillian would like to **analyze paper 18's content** in the context of the other papers with known authors, to see if she can generate some evidence that the suspected collaboration between Hamilton and Madison is in fact

2. Data Understanding

- The Federalist Papers are **available through a number of sources**:
 - They have been **re-published in book form**, they are available on a number of different web sites
 - Their text is archived in many libraries throughout the world
- Gillian's **data set** is simple (6 dataset):
 - Federalist03_Jay.txt
 - Federalist04_Jay.txt
 - Federalist05_Jay.txt
 - Federalist14_Madison.txt
 - Federalist17_Hamilton.txt
 - Federalist18_Collaboration.txt (*suspected*)

Modeling

Text Processing Extension Installation

Modeling

Operator
Read Document

Text Processing

Modelling with Annotation

Evaluation

- Gillian feels confident that **paper 18 is a collaboration** that John Jay did not contribute to
- His vocabulary and grammatical structure was quite different from those of **Hamilton and Madison**

5.4 Data Mining Laws

Tom Khabaza, Nine Laws of Data Mining, 2010
(http://khabaza.codimension.net/index_files/9laws.htm)

Data Mining Laws

1. **Business objectives** are the origin of every data mining solution
2. **Business knowledge** is central to every step of the data mining process
3. **Data preparation** is more than half of every data mining process
4. There is **no free lunch** for the data miner
5. There are **always patterns**
6. Data mining **amplifies perception** in the business domain
7. Prediction increases information locally by **generalisation**
8. The value of data mining results is **not determined by the accuracy or stability** of predictive models
9. All **patterns are subject to change**

Tom Khabaza, Nine Laws of Data Mining, 2010
(http://khabaza.codimension.net/index_files/9laws.htm)

1 Business Goals Law

Business objectives are the origin of every data mining solution

- This defines the field of data mining: data mining is concerned with solving business problems and achieving business goals
- Data mining is not primarily a technology; it is a process, which has one or more business objectives at its heart
- Without a business objective, there is no data mining
- The maxim: “Data Mining is a Business Process”

2 Business Knowledge Law

Business knowledge is central to every step of the data mining process

- A naive reading of CRISP-DM would see business knowledge used at the start of the process in defining goals, and at the end of the process in guiding deployment of results
- This would be to miss a key property of the data mining process, that business knowledge has a central role in every step

2 Business Knowledge Law

1. **Business understanding** must be based on business knowledge, and so must the **mapping of business objectives** to data mining goals
2. **Data understanding** uses business knowledge to understand **which data is related to the business problem**, and how it is related
3. **Data preparation** means using business knowledge to shape the data so that the **required business questions can be asked** and answered
4. **Modelling** means using data mining algorithms to create predictive models and **interpreting both the models and their behaviour in business terms** – that is, understanding their business relevance
5. **Evaluation** means understanding the **business impact of using the models**
6. **Deployment** means putting the data mining **results to work in a business process**

3 Data Preparation Law

Data preparation is more than half of every data mining process

- Maxim of data mining: most of the effort in a data mining project is spent in data acquisition and preparation, and informal estimates vary from 50 to 80 percent
- The purpose of data preparation is:
 1. To put the data into a form in which the data mining question can be asked
 2. To make it easier for the analytical techniques (such as data mining algorithms) to answer it

4 No Free Lunch Theory

There is No Free Lunch for the Data Miner (NFL-DM)

The right model for a given application can only be discovered by experiment

- Axiom of machine learning: if we knew enough about a problem space, we could choose or **design an algorithm to find optimal solutions** in that problem space with maximal efficiency
- Arguments for the superiority of one algorithm over others in data mining rest on the idea that data mining problem spaces have one particular set of properties, or that **these properties can be discovered by analysis and built into the algorithm**
- However, these views arise from the erroneous idea that, in data mining, **the data miner formulates the problem** and **the algorithm finds the solution**
- In fact, the **data miner both formulates the problem and finds the solution** – the **algorithm is merely a tool** which the data miner uses to assist with certain steps in this process

4 No Free Lunch Theory

- If the problem space were well-understood, the **data mining process would not be needed**
 - Data mining is the **process of searching for as yet unknown connections**
- For a given application, there is **not only one problem space**
 - Different models may be used to solve **different parts of the problem**
 - The way in which the problem is decomposed is itself often the result of data mining and **not known before the process begins**
- The data miner manipulates, or “shapes”, the problem space **by data preparation**, so that the grounds for evaluating a model are constantly shifting
- There is **no technical measure** of value for a predictive model
- The **business objective itself undergoes revision** and development during the data mining process
 - so that the **appropriate data mining goals may change** completely

5 Watkins' Law

There are always patterns

- This law was first stated by **David Watkins**
- There is **always something interesting to be found** in a business-relevant dataset, so that even if the expected patterns were not found, something else useful would be found
- A data mining project would not be undertaken unless **business experts expected that patterns would be present**, and it should not be surprising that the experts are usually right

6 Insight Law

Data mining amplifies perception in the business domain

- How does data mining produce insight? This law approaches the heart of data mining – **why it must be a business process and not a technical one**
 - **Business problems are solved by people**, not by algorithms
- The **data miner and the business expert “see” the solution** to a problem, that is the patterns in the domain that allow the business objective to be achieved
 - Thus data mining is, or **assists as part of, a perceptual process**
 - Data mining **algorithms reveal patterns that are not normally visible** to human perception
- The **data mining process integrates these** algorithms with the normal human perceptual process, which is active in nature
- Within the data mining process, the **human problem solver interprets the results of data mining algorithms and integrates them into their business understanding**

7 Prediction Law

Prediction increases information locally by generalisation

- “Predictive models” and “predictive analytics” means “predict the most likely outcome”
- Other kinds of data mining models, such as clustering and association, are also characterised as “predictive”; this is a much looser sense of the term:
 - A clustering model might be described as “predicting” the group into which an individual falls
 - An association model might be described as “predicting” one or more attributes on the basis of those that are known
- What is “prediction” in this sense? What do classification, regression, clustering and association algorithms and their resultant models have in common?
 - The answer lies in “scoring”, that is the application of a predictive model to a new example
 - The available information about the example in question has been increased, locally, on the basis of the patterns found by the algorithm and embodied in the model, that is on the basis of generalisation or induction

8 Value Law

The **value** of data mining results is **not determined by the accuracy or stability of predictive models**

- **Accuracy and stability** are useful measures of how well a predictive model makes its predictions
 - **Accuracy** means how often the predictions are **correct**
 - **Stability** means how much the predictions would change if the data used to create the model were a different sample from the same population
- The **value of a predictive model** arises in two ways:
 - The model's predictions drive improved **(more effective) action**
 - The **model delivers insight** (new knowledge) which leads to improved strategy

9 Law of Change

All patterns are subject to change

- The patterns discovered by data mining **do not last forever**
- In marketing and CRM applications of data mining, it is well-understood that **patterns of customer behaviour are subject to change over time**
 - Fashions change, markets and competition change, and the economy changes as a whole; for all these reasons, **predictive models become out-of-date** and should be refreshed regularly or when they cease to predict accurately
 - The same is true in risk and fraud-related applications of data mining. **Patterns of fraud change** with a changing environment and **because criminals change their behaviour** in order to stay ahead of crime prevention efforts

Tugas Menyelesaikan Masalah Organisasi

- Analisis **masalah dan kebutuhan yang ada di organisasi lingkungan sekitar** anda
- Kumpulkan dan **review dataset yang tersedia**, dan hubungkan masalah dan kebutuhan tadi dengan data yang tersedia (**analisis dari 5 peran data mining**)
 - Bila memungkinkan pilih **beberapa peran sekaligus untuk mengolah data** tersebut, misalnya: lakukan association (analisis faktor), sekaligus estimation atau clustering
- Lakukan proses **CRISP-DM** untuk menyelesaikan masalah yang ada di organisasi sesuai dengan data yang didapatkan
 - Pada proses **data preparation**, lakukan data cleaning (replace missing value, replace, filter attribute) sehingga data siap dimodelkan
 - Lakukan juga **komparasi algoritma** dan **feature selection** untuk memilih pola dan model terbaik
 - Rangkumkan **evaluasi** dari pola/model/knowledge yang dihasilkan dan relasikan hasil evaluasi dengan **deployment** yang dilakukan
- Rangkumkan dalam **bentuk slide** dengan contoh studi kasus Sarah untuk membantu bidang marketing

Studi Kasus Organisasi

Organisasi	Masalah	Tujuan	Dataset
KPK	- Sulitnya mengidentifikasi profil koruptor - Tidak patuhnya WL dalam LHKPN	Klasifikasi Profil Pelaku Korupsi Asosiasi Atribut Pelaku Korupsi Klasifikasi Kepatuhan LHKPN Estimasi Penentuan Angka Tuntutan	- LHKPN - Penuntutan
BSM	Sulit mengidentifikasi faktor apa yang mempengaruhi kualitas pembiayaan	Klasifikasi kualitas profil nasabah	Data pembiayaan nasabah
LKPP	Banyaknya konsultasi dan pertanyaan dari berbagai instansi yg harus dijawab	Asosiasi pola pertanyaan instansi Klasifikasi jenis pertanyaan	Data konsultasi
BPPK	Sulitnya penanganan tweet dari masyarakat, apakah terkait pertanyaan, keluhan atau saran	Klasifikasi dan Klustering text mining dari keluhan atau pertanyaan atau saran di media sosial	Data twitter masyarakat
Universitas Siliwangi	Tingkat kelulusan tepat waktu belum maksimal (apakah dikarenakan faktor jurusan atau faktor lain?)	Klasifikasi data kelulusan mahasiswa	Data mahasiswa

Studi Kasus Organisasi

Organisasi	Masalah	Tujuan	Dataset
Kemenkeu (DJPB)	Sulit menentukan faktor refinement indicator kinerja	1. Seberapa erat hubungan antar komponen terhadap potensi penyempurnaan 2. Klustering data kinerja organisasi	Data kinerja organisasi
Kemenkeu (DJPB)	Sulit menentukan arah opini hasil audit kementerian	1. Melihat hubungan beberapa data terhadap opini 2. Klasifikasi profil kementerian	Data profil kementerian
Kemenkeu (DJPB)	Banyaknya pelaporan kanwil yang harus dianalisis dengan beragam atribut	1. Melihat hubungan beberapa indikator laporan kanwil terhadap akurasi 2. Klustering data pelaporan kanwil 3. Klasifikasi akurasi pelaporan kanwil	Data pelaporan kanwil
Kemenkeu (DJPB)	Sulit menentukan prioritas monitoring kanwil	1. Klustering data profil kanwil 2. Melihat hubungan beberapa atribut terhadap kluster profil kanwil	Data transaksi dan profil kanwil

Studi Kasus Organisasi

Organisasi	Masalah	Tujuan	Dataset
